3	4.00	7.20

SHEAR FAILURE CRITERIA

Assumptions and formula used in calculation as per IS:6403-1981 are given below -

NOTE: The type of failure used for bearing capacity analysis depends upon the value of void ratio (see IS 6403 : 1981, Page No. 9, Table No. 3).

The ultimate net bearing capacity in case of general shear failure is given by (from IS 6403 : 1981, page No. 8)

$$q_d = c\, N_c\, s_c\, d_c\, i_c + q\, (N_q\text{-}1)\, s_q\, d_q\, i_q + (1/2)\, B\, \gamma\, N_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$$

The ultimate net bearing capacity in case of local shear failure is given by (from IS 6403 : 1981, page No. 8)

$$q'_d = (2/3)\, c\, N'_c\, s_c\, d_c\, i_c + q\, (N'_q\text{-}1)\, s_q\, d_q\, i_q + (1/2)\, B\, \gamma\, N'_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$$

Where,

d_c = 1+ 0.2 (D_f/B)*SQRT(N_ϕ)
$d_q = d_\gamma$ = 1 for ϕ <10°
$d_q = d_\gamma$ = 1 + 0.1 (D_f/B)*SQRT(N_ϕ) for ϕ >10°
(from IS 6403 : 1981, page No. 9)
$N_\phi = \tan^2(\pi/4 + \phi/2)$
ϕ' is friction angle for local shear failure = $\tan^{-1}$ (0.67 tanϕ)

OUTPUT

The computer aided results for shear failure criteria are tabulated below. The results are interpolated values of bearing capacity obtained from general and local shear failure criteria.

Bearing capacity factors : (from IS 6403 : 1981, page No. 8, Table No. 1)

ϕ	4.00	ϕ'	2.68
N_c	6.19	N'_c	5.81
N_q	1.43	N'_q	1.27

SHEAR FAILURE CRITERIA

Assumptions and formula used in calculation as per IS:6403-1981 are given below -

NOTE: The type of failure used for bearing capacity analysis depends upon the value of void ratio (see IS 6403 : 1981, Page No. 9, Table No. 3).

The ultimate net bearing capacity in case of general shear failure is given by (from IS 6403 : 1981, page No. 8)

$$q_d = c\ N_c\ s_c\ d_c\ i_c + q\ (N_q\text{-}1)\ s_q\ d_q\ i_q + (1/2)\ B\ \gamma\ N_\gamma\ s_\gamma\ d_\gamma\ i_\gamma\ W'$$

The ultimate net bearing capacity in case of local shear failure is given by (from IS 6403 : 1981, page No. 8)

$$q'_d = (2/3)\ c\ N'_c\ s_c\ d_c\ i_c + q\ (N'_q\text{-}1)\ s_q\ d_q\ i_q + (1/2)\ B\ \gamma\ N'_\gamma\ s_\gamma\ d_\gamma\ i_\gamma\ W'$$

Where,

$d_c = 1 + 0.2\ (D_f/B)*SQRT(N_\phi)$

$d_q = d_\gamma = 1$ for $\phi < 10^o$

$d_q = d_\gamma = 1 + 0.1\ (D_f/B)*SQRT(N_\phi)$ for $\phi > 10^o$

(from IS 6403 : 1981, page No. 9)

$N_\phi = \tan^2(\pi/4 + \phi/2)$

ϕ' is friction angle for local shear failure = $\tan^{-1}$ (0.67 $\tan\phi$)

"General Requirements for the Competence of Testing & Calibration Laboratories"

for its facilities at

114, RAM GANGA HOUSING SOCIETY, NARAMAU, G.T. ROAD, KANPUR, UTTAR PRADESH, INDIA

in the field of

TESTING

Certificate Number: TC-9169

Issue Date: 23/12/2022 Valid Until: 22/12/2024

This certificate remains valid for the Scope of Accreditation as specified in the annexure subject to continued satisfactory compliance to the above standard & the relevant requirements of NABL.
(To see the scope of accreditation of this laboratory, you may also visit NABL website www.nabl-india.org)

ACKNOWLEDGEMENTS

We are pleased to submit the part-1 of the report of Geotechnical investigation, conducted for the boreholes A1 and P1 to P20 for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)
B.Tech. (Civil), M.Tech.
Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -1 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers A1 and P1 to P20.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15’ N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

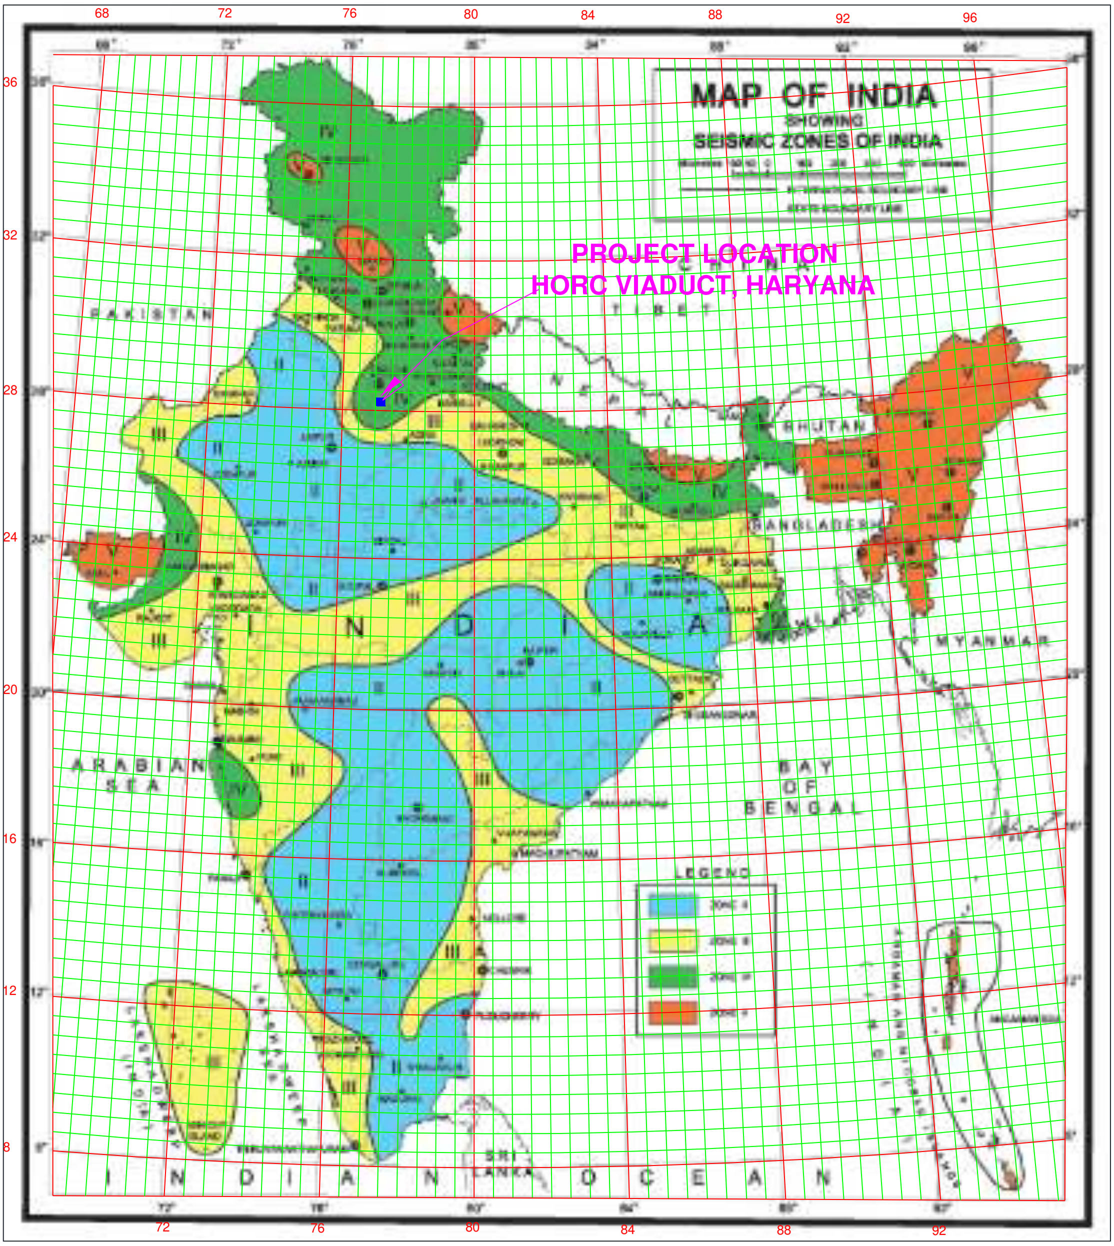

Fig.1: Seismic Zone Map of India

4. FIELD INVESTIGATION:

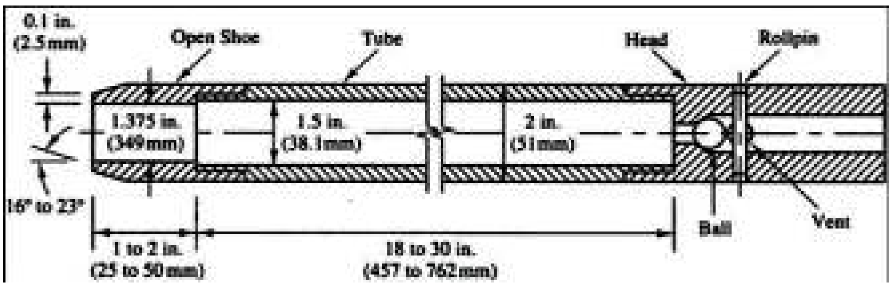
The field investigation work at this site was carried out from Sep 20th; 2023 to Sep 23rd; 2023 & Oct 15th; 2023 to Oct 22nd; 2023. The following investigation

work was carried out:

4.1. **Six number** of **boreholes** (marked as A1, P6, P12, P13, P17 & P18) of diameter 150 mm in soil were made within the proposed alignment for conducting Standard Penetration Test and collection of disturbed and undisturbed soil samples. The boreholes were progressed using power operated winch machine under percussion method of drilling. Casing was used to keep the borehole stable, and Bentonite was also used as drilling mud to help prevent wall collapse of boreholes at deeper depth. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in "TEST LOCATION PLAN" in Appendix A.

4.2. **Standard Penetration Tests** were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **auto-trip hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is

termed the penetration resistance N. The N' values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		Correlation For Sand/Non-Plastic Silt	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 50 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77x \log (2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 to 6 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. **Disturbed soil samples** were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 to 6 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. **Undisturbed soil samples** were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness

of not less than 25 mm. The laboratory test results have been reported in Table 1 to 6 of Appendix-B.

4.5. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.6. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.5. **Atterbergs' limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) - 1980-(RA: 2021) and the results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.7. **Consolidation tests** were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.8. **Direct shear tests** were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.9. **Tri-axial Compression Test** under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.10. **Unconfined Compressive strength tests** were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 9 of Appendix B

5.11. **Shrinkage Limit tests** were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.12. **Free Swell Index** were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 to 6: "SUMMARY OF TEST RESULTS" of Appendix B.

5.13. **Chemical analysis on soil samples** was performed in accordance with IS: 2720 (Part-XXVI)-1987-(RA: 2021) for pH value, IS: 2720 (Part-XXVII)-1977-(RA: 2020) for Sulphate & BS:1377-3-2018 for chlorides and results have been reported in Table 7 "CHEMICAL TEST ON SOIL SAMPLES" of Appendix B.

5.14. **Chemical analysis on Ground Water sample** was performed in accordance with IS: 3025 (Part-XI)-2022 for pH value, IS: 3025 (Part-XXIV: Sec-1)-2022 for Sulphate & IS: 3025-(Part-XXXII)-1988-(RA: 2019) for chlorides and results have been reported in

Table 8 “CHEMICAL TEST ON GROUND WATER SAMPLES” of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
A1	20915.887	702633.931	3118903.449	191.636	40.00	0.50
P6	21073.087	702477.831	3118922.470	192.181	40.00	1.20
P12	21230.287	702321.763	3118941.487	191.831	40.00	1.50
P13	21256.487	702295.755	3118944.656	191.690	40.00	1.50
P17	21361.287	702191.763	3118957.327	191.107	40.00	1.20
P18	21387.487	702165.761	3118960.484	191.128	40.00	1.20

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS: 13365-1. The detailed nature of the strata has been reported in Table 1 to 6: “SUMMARY OF TEST RESULTS” of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in the bore holes, is predominantly comprising of inorganic silty clays of low plasticity and inorganic silts of non to low plastic category. Silty sands were encountered at variable depth and thickness of 4 to 18 meters. Some lenses consisting of Inorganic silts and silty clays of intermediate plasticity were also found in some of the bores.

8. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation **(Bored Cast-In-Situ RCC piles)** have been considered for computation of load bearing capacity of the underlying soil strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020) with due consideration of effects of liquefaction.

8.1. Design Parameters:

Factor of safety in compression	=	2.50
Factor of safety in tension	=	3.00
Depth of critical water table	=	0.00 m
Diameter of pile	=	1.00 & 1.20 m
Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

8.2. Computation of friction along pile stem:

$Q_{uf} = \sum K_i.P_{di}.\tan\delta_i.A_{si}$

where,

Q_{uf} = Ultimate shaft friction (kN/m^2)

K_i = Coefficient of earth pressure at mid-depth of ith layer

P_{di} = Effective overburden pressure at mid-depth of ith layer (kN/m^2)

A_{si} = Surface area of pile stem in ith layer (m^2)

δ_i = Angle of wall friction between pile and soil of ith layer (= ϕ) (degree)

ϕ_i = Angle of internal friction of soil in ith layer (degree)

$\sum$ = Sum of all layers up to ith layer

8.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \sum \alpha_i.c_i.A_{si}$

where,

c_i = Cohesion in ith layer

A_{si} = Surface area of pile stem in ith layer (m^2)

α_i = Adhesion factor for ith layer of soil depending of consistency of soils

$\sum$ = Sum of cohesion of all layers considered

8.4. Computation of end bearing resistance:

$Q_{ub} = A_p\,(c.N_c + q.N_q + 0.5.\,\gamma.B.N_\gamma)$

where,

A_p = Area of the pile toe (m^2)

c = cohesion of soils at pile toe (kN/m^2)

γ = Effective Unit weight of soils at pile toe (kN/m^3)

B = Diameter of pile (m)

q = Effective overburden pressure at pile toe (kN/m^2)

N_c = Bearing Capacity Factor (Recommended equal to 9)

N_q, N_γ = Bearing Capacity Factor

8.5. Lateral load capacity of piles in soils:

$Q_u = 12.E.I.\delta/(L_1+L_f)^3$

where,

Q_u = Ultimate lateral load capacity of pile (kN)

δ = Permissible deflection (m) = 5 mm

E = Young Modulus of pile material (kN/m^2)

I = Moment of Inertia of the pile cross section (m^4)

L_1 = Cantilever Length of pile (m)

L_f = Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-1 to 2** of **Appendix-H.**

Pile lateral Load capacity has been given in **Table-3 to 4** of **Appendix-H**.

9. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place, normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (Energy correction factor)

Design Earthquake Base:

Earthquake zone	= IV
Magnitude of earthquake	= 7
Seismic Zone factor	= 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

< 1.00 : Stratum is to be considered as liquefiable

> 1.00 : Non-Liquefiable

The detailed calculations of liquefaction, have been reported in **Table-5** of **Appendix-H.**

10. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

10.1. Bored Cast-In-Situ RCC Piles of diameter 1000 and 1200 mm have been adopted for SBC computations of foundation for Viaduct.

10.2. Cut off length of piles have been considered as 2.50 m from the existing ground level for the purpose of computation of SBC.

10.3. Pile length recommended in the table below, shall be measured **after the cut-off depth.**

10.4. Allowable load carrying capacity of pile corresponding to the length and diameter of pile shall be read from the tables below:

10.4.1. For Pile diameter = 1000 mm

Borehole No.	Pile Length (m)	Load carrying Capacity (kN)		
		Compression	Uplift	Lateral Concrete M35*
A1	25.00	1950	1500	45
	27.50	2300	1700	
	30.00	2950	1900	
	32.50	3850	2150	
	35.00	3100	2400	
P6	25.00	2200	1700	160
	27.50	2450	1900	
	30.00	2650	2150	
	32.50	2850	2300	
	35.00	3300	2500	

Borehole No.	Pile Length (m)	Load carrying Capacity (kN)		
		Compression	Uplift	Lateral Concrete M35*
P12	25.00	2350	1850	120
	27.50	3350	2050	
	30.00	3900	2300	
	32.50	4150	2550	
	35.00	4450	2800	
P13	25.00	1850	1400	35
	27.50	2100	1650	
	30.00	2900	1850	
	32.50	3150	2050	
	35.00	3350	2250	
P17	25.00	1950	1500	40
	27.50	2200	1750

10.5. Liquefaction Potential: All the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. Out of which several boreholes show the potential at various depths mentioned in the table below:

Bore No.	Liquefiable depth zone (meter)
A1	Top 1.00, 3.00 to 4.00 & 6.00 to 7.00
P6	Top 1.00
P12	Top 1.00
P13	Top 1.00, 2.00 to 3.00, 4.00 to 6.00, 7.00 to 10.00
P17	2.00 to 9.00
P18	Top 3.00

10.6. Type of cement to be used: Chloride content in the soil sample is slightly higher but still within the permissible limits. Other harmful salt sulphite is much low to the permissible limits. Hence, Ordinary Portland Cement or Portland Pozzolana Cement may be used for all civil constructions.

for Techpro Engineers Pvt. Ltd.

ACKNOWLEDGEMENTS

We are pleased to submit the part-2 of the report of Geotechnical investigation, conducted for the boreholes P21 to P40 for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)
B.Tech. (Civil), M.Tech.
Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -2 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers P21 to P40.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15’ N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

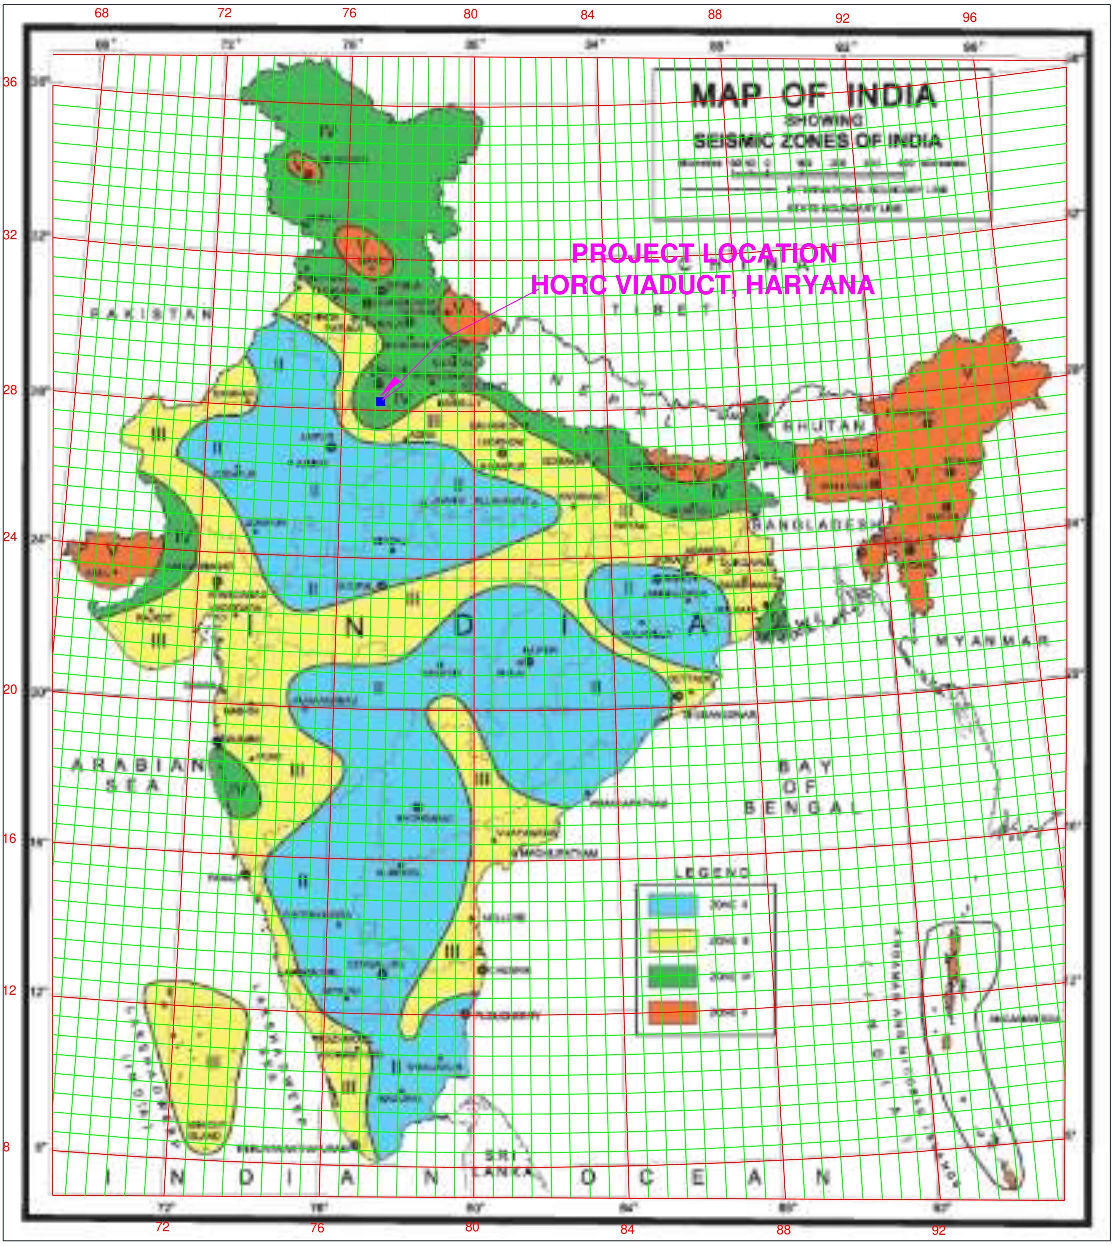

Fig.1: Seismic Zone Map of India

4. FIELD INVESTIGATION:

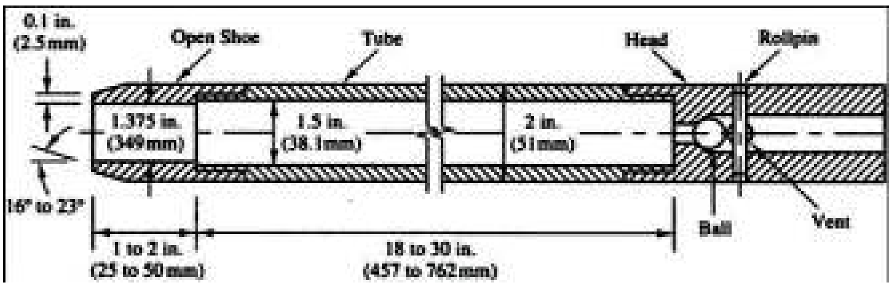
The field investigation work at this site was carried out from Sep 24th; 2023 to Sep 27th; 2023, Oct 15th; 2023 to Oct 22nd; 2023 & Nov 06th; 2023 to Nov 09th;

2023. The following investigation work was carried out:

4.1. **Eight number** of **boreholes** (marked as P24, P30, P32, P33, P34, P36, P39 & P40) of diameter 150 mm in soil were made within the proposed alignment for conducting Standard Penetration Test and collection of disturbed and undisturbed soil samples. The boreholes were progressed using power operated winch and hydraulic rig machine under **percussion** and **rotary** method of drilling respectively. Casing was used to keep the borehole stable, and Bentonite was also used as drilling mud to help prevent wall collapse of boreholes at deeper depth. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in "TEST LOCATION PLAN" in Appendix A.

4.2. **Standard Penetration Tests** were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **auto-trip and rope-pulley driven hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is

termed the penetration resistance N. The N' values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		**Correlation For Sand/Non-Plastic Silt**	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 80 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77x \log (2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 to 8 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. Disturbed soil samples were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 to 8 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. Undisturbed soil samples were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness

of not less than 25 mm. The laboratory test results have been reported in Table 1 to 8 of Appendix-B.

4.5. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.6. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 to 8: “SUMMARY OF TEST RESULTS” of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 to 8: “SUMMARY OF TEST RESULTS” of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 to 8: “SUMMARY OF TEST RESULTS” of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 to 8: “SUMMARY OF TEST RESULTS” of Appendix B.

5.5. **Atterbergs’ limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 to 8: “SUMMARY OF TEST RESULTS” of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) - 1980-(RA: 2021) and the results have been reported in Table 1 to 8: "SUMMARY OF TEST RESULTS" of Appendix B.

5.7. **Consolidation tests** were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 to 8: "SUMMARY OF TEST RESULTS" of Appendix B.

5.8. **Direct shear tests** were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 to 8: "SUMMARY OF TEST RESULTS" of Appendix B.

5.9. **Tri-axial Compression Test** under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 to 8: "SUMMARY OF TEST RESULTS" of Appendix B.

5.10. **Unconfined Compressive strength tests** were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 11 of Appendix B.

5.11. **Shrinkage Limit tests** were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 to 8: "SUMMARY OF TEST RESULTS" of Appendix B.

5.12. **Free Swell Index** were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 to 8: "SUMMARY OF TEST RESULTS" of Appendix B.

5.13. **Chemical analysis on soil samples** was performed in accordance with IS: 2720 (Part-XXVI)-1987-(RA: 2021) for pH value, IS: 2720 (Part-XXVII)-1977-(RA: 2020) for Sulphate & BS:1377-3-2018 for chlorides and results have been reported in Table 9 "CHEMICAL TEST ON SOIL SAMPLES" of Appendix B.

5.14. **Chemical analysis on Ground Water sample** was performed in accordance with IS: 3025 (Part-XI)-2022 for pH value, IS: 3025 (Part-XXIV: Sec-1)-2022 for Sulphate & IS: 3025-(Part-XXXII)-1988-(RA: 2019) for chlorides and results have been reported in

Table 10 "CHEMICAL TEST ON GROUND WATER SAMPLES" of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P24	21544.687	702009.821	3118982.298	192.043	40.00	1.40
P30	21701.887	701856.668	3119020.255	191.396	40.00	1.50
P32	21754.287	701806.797	3119037.179	191.328	40.00	1.30
P33	21780.487	701782.232	3119046.389	191.287	40.00	1.35
P34	21806.687	701757.766	3119056.154	191.452	40.00	1.40
P36	21859.087	701709.564	3119077.181	191.271	40.00	1.30
P39	21937.687	701638.957	3119112.511	191.204	40.00	1.30
P40	21963.887	701615.905	3119125.287	191.009	40.00	1.40

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS: 13365-1. The detailed nature of the strata has been reported in Table 1 to 8: "SUMMARY OF TEST RESULTS" of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in the boreholes, is predominantly comprising of inorganic silty clays of low plasticity and inorganic silts of non to low plastic category. Silty sands were encountered at variable depth and thickness. Inorganic silts and silty clays of intermediate plasticity were also encountered at some depth and thickness in some of the bores.

8. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation **(Bored Cast-In-Situ RCC piles)** have been considered for computation of load bearing capacity of the underlying soil strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020) with due consideration of effects of liquefaction.

8.1. Design Parameters:

Factor of safety in compression	=	2.50
Factor of safety in tension	=	3.00
Depth of critical water table	=	0.00 m
Diameter of pile	=	1.00 & 1.20 m
Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

8.2. Computation of friction along pile stem:

$Q_{uf} = \sum K_i . P_{di} . \tan\delta_i . A_{si}$

where,

Q_{uf} = Ultimate shaft friction (kN/m^2)

K_i = Coefficient of earth pressure at mid-depth of ith layer

P_{di} = Effective overburden pressure at mid-depth of ith layer (kN/m^2)

A_{si} = Surface area of pile stem in ith layer (m^2)

δ_i = Angle of wall friction between pile and soil of ith layer (= ϕ) (degree)

ϕ_i = Angle of internal friction of soil in ith layer (degree)

$\sum$ = Sum of all layers up to ith layer

8.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \sum \alpha_i . c_i . A_{si}$

Where,

c_i = Cohesion in ith layer

A_{si} = Surface area of pile stem in ith layer (m^2)

α_i = Adhesion factor for ith layer of soil depending of consistency of soils

$\sum$ = Sum of cohesion of all layers considered

8.4. Computation of end bearing resistance:

$$Q_{ub} = A_p\,(c.N_c + q.N_q + 0.5.\,\gamma.B.N_\gamma)$$

Where,

A_p = Area of the pile toe (m^2)

c = cohesion of soils at pile toe (kN/m^2)

γ = Effective Unit weight of soils at pile toe (kN/m^3)

B = Diameter of pile (m)

q = Effective overburden pressure at pile toe (kN/m^2)

N_c = Bearing Capacity Factor (Recommended equal to 9)

N_q, N_γ = Bearing Capacity Factor

8.5. Lateral load capacity of piles in soils:

$$Q_u = 12.E.I.\delta/(L_1+L_f)^3$$

where,

Q_u = Ultimate lateral load capacity of pile (kN)

δ = Permissible deflection (m) = 1% of diameter of pile

E = Young Modulus of pile material (kN/m^2)

I = Moment of Inertia of the pile cross section (m^4)

L_1 = Cantilever Length of pile (m)

L_f = Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-1 to 2** of **APPENDIX-H.**

Pile lateral Load capacity has been given in **Table-3 to 4** of **APPENDIX-H**.

9. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations.

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (energy efficiency factor)

Design Earthquake Base:

Earthquake zone	= IV
Magnitude of earthquake	= 7
Seismic Zone factor	= 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

< 1.00 : Stratum is to be considered as liquefiable.

> 1.20 : Non-Liquefiable

The detailed calculations of liquefaction have been reported in **Table-5** of **APPENDIX-H.**

10. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

10.1. **Bored Cast-In-Situ RCC Piles** of diameter 1000 and 1200 mm have been adopted for SBC computations of foundation for Viaduct.

10.2. **Cut off length** of piles have been considered as 2.50 m from the existing ground level for the purpose of computation of SBC.

10.3. **Pile length** recommended in the table below, shall be measured **after the cut-off depth.**

10.4. **Allowable load carrying capacity** of pile corresponding to the length and diameter of pile shall be read from the tables below:

10.4.1. For Pile diameter = 1000 mm

Borehole No.	Pile Length (m)	Load carrying Capacity (kN)		
		Compression	Uplift	Lateral Concrete M35*
P24	25.00	2350	1750	55

10.5. Liquefaction Potential: All the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. Out of which several boreholes show the potential at various depths mentioned in the table below:

Bore No.	Liquefiable depth zone (meter)
P24	Top 1.00 & 6.00 to 7.00
P30	Top to 10.00
P32	Top 1.00 & 2.00 to 8.00

Bore No.	Liquefiable depth zone (meter)
P33	Top 6.00
P34	Top 4.00
P36	1.00 to 3.00
P39	Top 9.00
P40	Top 1.00, 5.00 to 6.00 & 8.00 to 9.00

10.6. Type of cement to be used: Harmful chemical contents in the soil samples are within the permissible limit. So, Ordinary Portland Cement or Portland Pozzolana Cement may be used for all civil constructions.

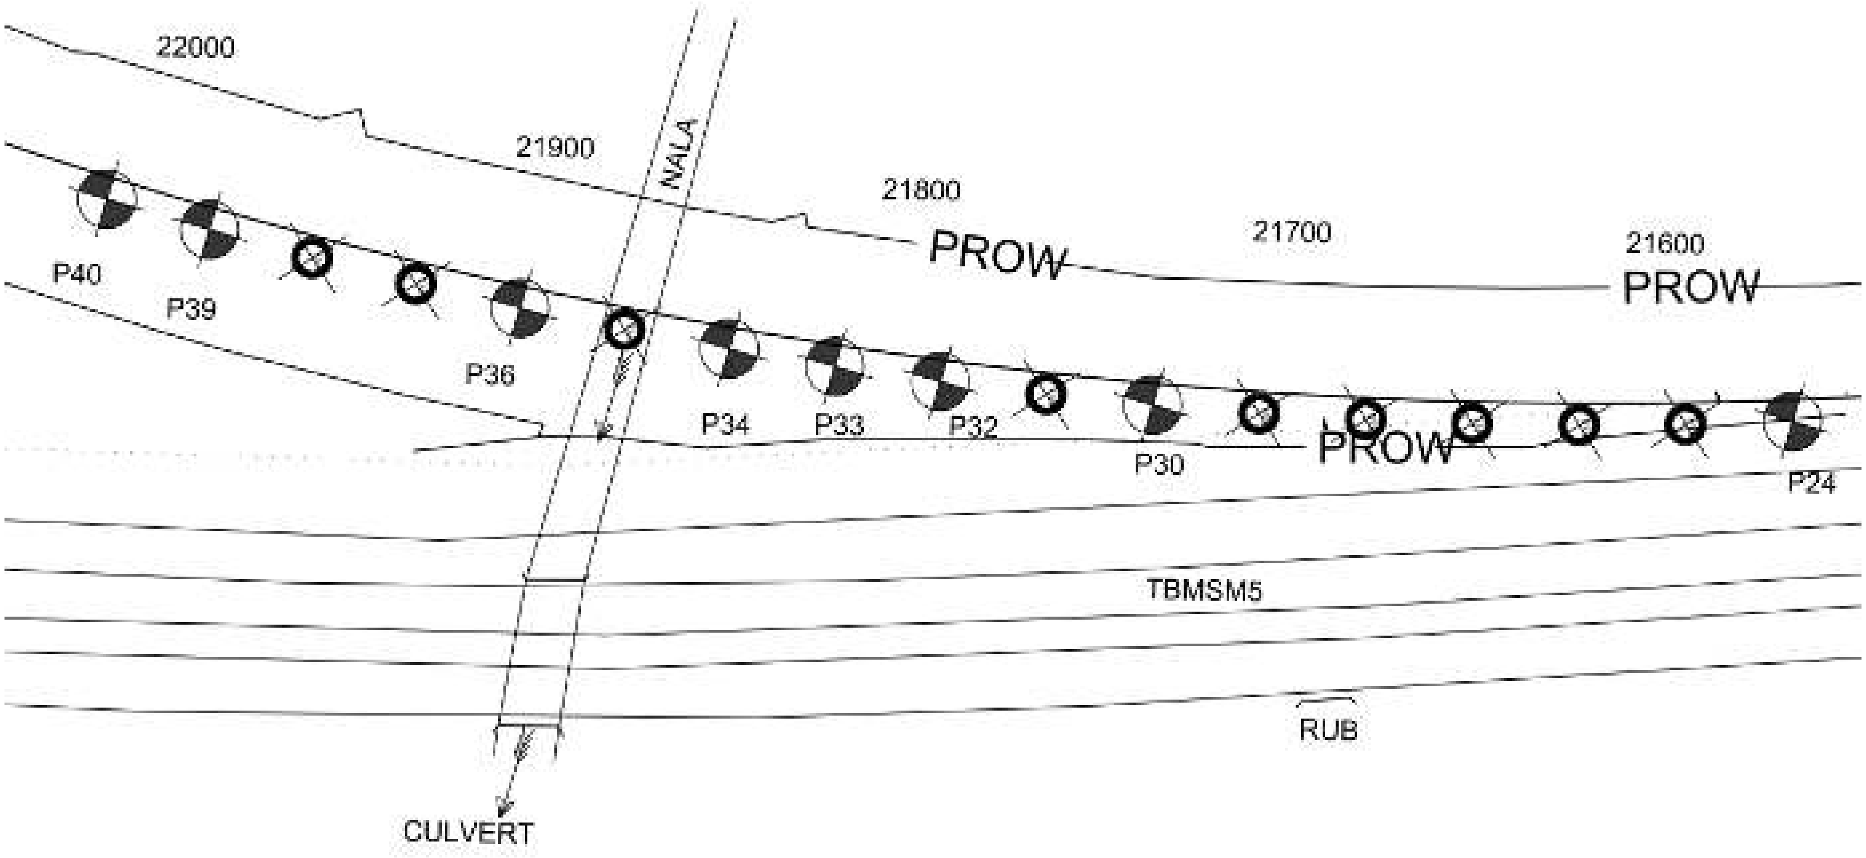
Managing Director

APPENDIX-A
TEST LOCATION PLAN



APPENDIX "B"
TABLE 1: SUMMARY OF TEST RESULTS

Bore No: P24	**Ground Elevation: RL 192.043 m**	**Method of drilling: Percussion**	**Depth of Water: 1.40 m**
Diameter of Bore Hole: 150 mm	**Bore Retained using: Casing**	**Starting Date: 24/09/2023**	**SPT Sampler: Standard**
Location / Chainage: 21544.687	**Casing Lowered: 19.00 m**	**Ending Date: 27/09/2023**	**Hammer type: Auto-trip**

FIELD TEST RESULT										LABORATORY TEST RESULT

APPENDICES

National Accreditation Board for Testing and Calibration Laboratories

NABL

CERTIFICATE OF ACCREDITATION

TECHPRO ENGINEERS PVT. LTD. (LABORATORY DIVISION)

has been assessed and accredited in accordance with the standard

ISO/IEC 17025:2017

"General Requirements for the Competence of Testing & Calibration Laboratories"

for its facilities at

114, RAM GANGA HOUSING SOCIETY, NARAMAU, G.T. ROAD, KANPUR, UTTAR PRADESH, INDIA

in the field of

TESTING

Certificate Number:	TC-9169		
Issue Date:	23/12/2022	Valid Until:	22/12/2024

This certificate remains valid for the Scope of Accreditation as specified in the annexure subject to continued satisfactory compliance to the above standard & the relevant requirements of NABL.
(To see the scope of accreditation of this laboratory, you may also visit NABL website www.nabl-india.org)

ACKNOWLEDGEMENTS

We are pleased to submit the part-3 of the report of Geotechnical investigation, conducted for the boreholes P41 to P60 for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)
B.Tech. (Civil), M.Tech.
Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -3 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers P41 to P60.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15' N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

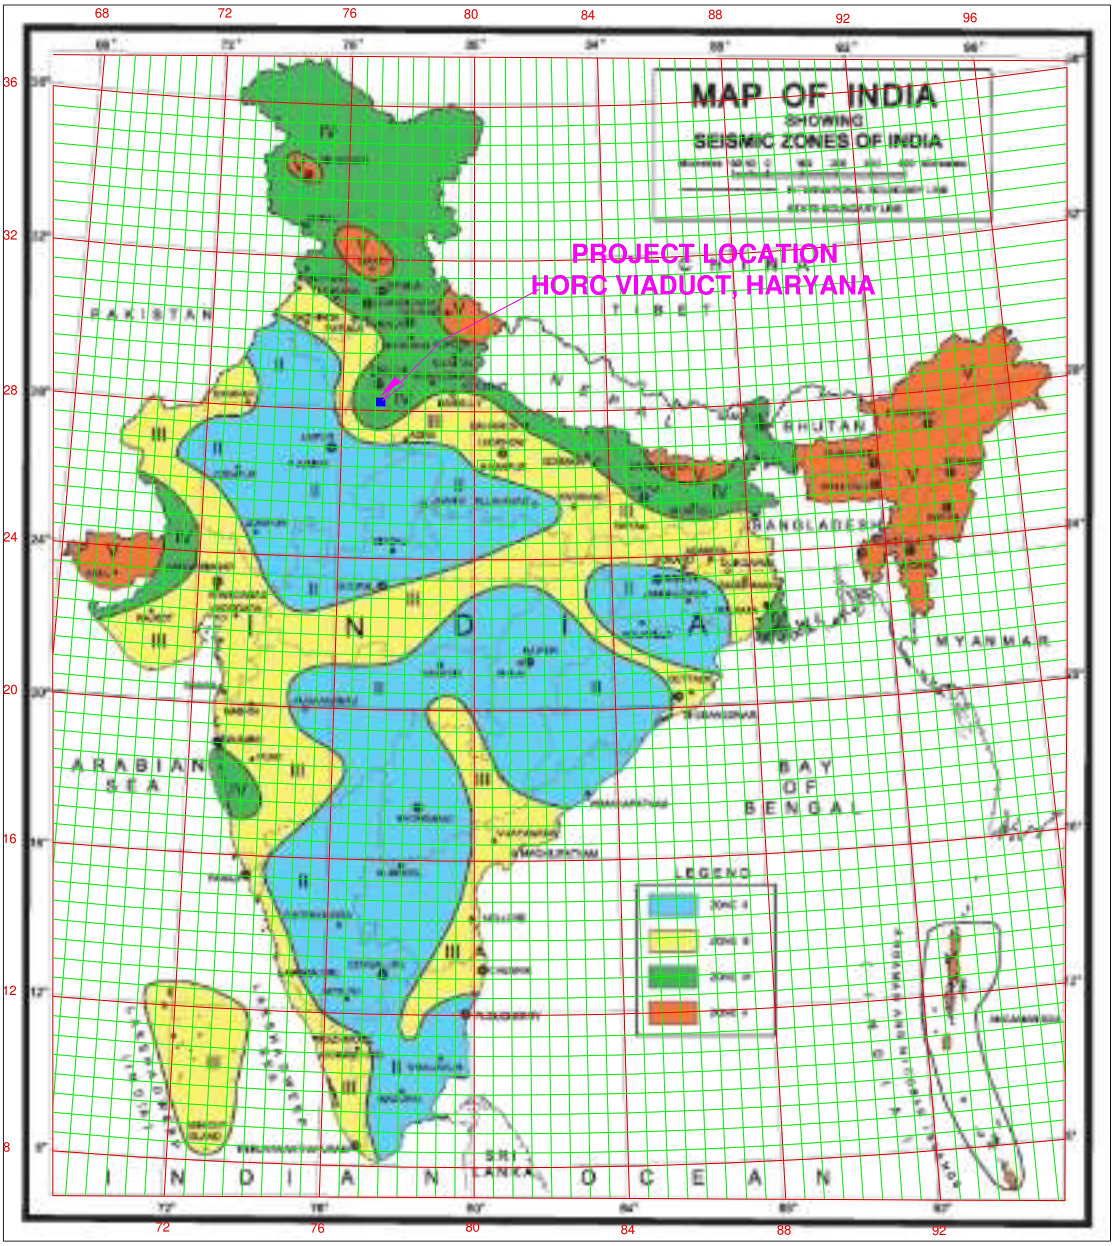

Fig.1: Seismic Zone Map of India

4. FIELD INVESTIGATION:

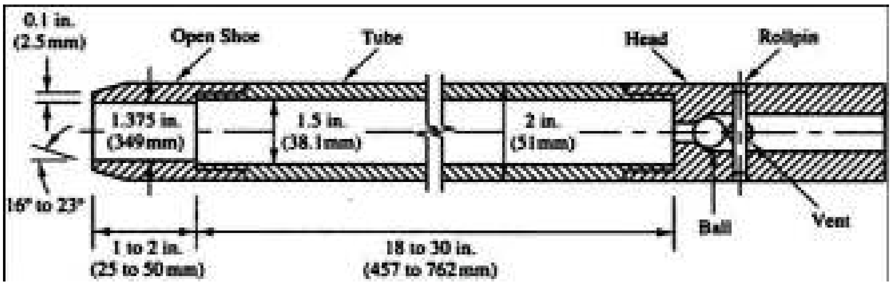
The field investigation work at this site was carried out from Sep 27th; 2023 to Oct 2nd; 2023 & Oct 12th; 2023 to Oct 22nd; 2023 & Oct 31st; 2023 to Nov 10th

2023. The following investigation work was carried out:

4.1. Twenty number of **boreholes** (marked as P41 to P60) of diameter 150 mm in soil were made within the proposed alignment for conducting Standard Penetration Test and collection of disturbed and undisturbed samples. The boreholes were progressed using power operated winch machine under **percussion** method of drilling. Casing was used to keep the borehole stable. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in “TEST LOCATION PLAN” in Appendix A.

4.2. Standard Penetration Tests were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **auto-trip and rope-pulley driven hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is termed the penetration resistance N. The N’ values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		Correlation For Sand/Non-Plastic Silt	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 50 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77x \log (2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 to 20 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. **Disturbed soil samples** were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 to 20 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. **Undisturbed soil samples** were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness of not less than 25 mm. The laboratory test results have been reported in Table 1 to 20 of Appendix-B.

4.5. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.6. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.5. **Atterbergs' limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) -1980-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.7. **Consolidation tests** were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.8. **Direct shear tests** were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.9. **Tri-axial Compression Test** under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.10. **Unconfined Compressive strength tests** were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 22 of Appendix B.

5.11. **Shrinkage Limit tests** were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.12. **Free Swell Index** were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.13. **Chemical analysis on soil samples** was performed in accordance with IS: 2720 (Part-XXVI)-1987-(RA: 2021) for pH value, IS: 2720 (Part-XXVII)-1977-(RA: 2020) for Sulphate & BS:1377-3-2018 for chlorides and results have been reported in Table 21 "CHEMICAL TEST ON SOIL SAMPLES" of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P41	21990.087	701593.231	3119138.485	191.144	40.00	1.40

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS: 13365-1. The detailed nature of the strata has been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in the boreholes, is predominantly consisting of inorganic silty clays of low plasticity, inorganic silts of non to low plastic category and silty sands and silty sands at varying depth and thickness. Inorganic silty clays, silts of intermediate plasticity and silty sands with clays binders were also found at varying depths and thickness in some of the boreholes. An exception of inorganic silty clays of high plastic category was found in borehole P60 at the upper depth of 2.00 to 3.00 metres.

8. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation **(Bored Cast-In-Situ RCC piles)** have been considered for computation of load bearing capacity of the underlying soil strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020) with due consideration of effects of liquefaction.

8.1. Design Parameters:

Factor of safety in compression	=	2.50
Factor of safety in tension	=	3.00
Depth of critical water table	=	0.00 m
Diameter of pile	=	1.00 & 1.20 m
Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

8.2. Computation of friction along pile stem:

$Q_{uf} = \sum K_i . P_{di} . \tan\delta_i . A_{si}$

where,

Q_{uf} = Ultimate shaft friction (kN/m^2)

K_i = Coefficient of earth pressure at mid-depth of ith layer

P_{di} = Effective overburden pressure at mid-depth of ith layer (kN/m^2)

A_{si} = Surface area of pile stem in ith layer (m^2)

δ_i = Angle of wall friction between pile and soil of ith layer (= ϕ) (degree)

ϕ_i = Angle of internal friction of soil in ith layer (degree)

Σ = Sum of all layers up to ith layer

8.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \sum \alpha_i . c_i . A_{si}$

Where,

c_i = Cohesion in i^{th} layer

A_{si} = Surface area of pile stem in i^{th} layer (m^2)

α_i = Adhesion factor for i^{th} layer of soil depending of consistency of soils

$\sum$ = Sum of cohesion of all layers considered

8.4. Computation of end bearing resistance:

$Q_{ub} = A_p (c.Nc + q.Nq + 0.5. \gamma.B.N\gamma)$

Where,

A_p = Area of the pile toe (m^2)

c = cohesion of soils at pile toe (kN/m^2)

γ = Effective Unit weight of soils at pile toe (kN/m^3)

B = Diameter of pile (m)

q = Effective overburden pressure at pile toe (kN/m^2)

N_c = Bearing Capacity Factor (Recommended equal to 9)

$Nq, N\gamma$ = Bearing Capacity Factor

8.5. Lateral load capacity of piles in soils:

$Q_u = 12.E.I.\delta/(L_1+L_f)^3$

where,

Q_u = Ultimate lateral load capacity of pile (kN)

δ = Permissible deflection (m) = 1% of diameter of pile

E = Young Modulus of pile material (kN/m^2)

I = Moment of Inertia of the pile cross section (m^4)

L_1 = Cantilever Length of pile (m)

L_f = Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-1** to **2** of **Appendix-H.**

Pile lateral Load capacity has been given in **Table-3** to **4** of **Appendix-H**.

9. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (Energy correction factor)

Design Earthquake Base:

Earthquake zone = IV

Magnitude of earthquake = 7

Seismic Zone factor = 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

< 1.00 : Stratum is to be considered as liquefiable

> 1.20 : Non-Liquefiable

The detailed calculations of liquefaction, have been reported in **Table-5** of **Appendix-H.**

10. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

10.1. **Bored Cast-In-Situ RCC Piles** of diameter 1000 and 1200 mm have been adopted for SBC computations of foundation for Viaduct.

10.2. **Cut off length** of piles have been considered as 2.50 m from the existing ground level for the purpose of computation of SBC.

10.3. **Pile length** recommended in the table below, shall be measured **after the cut-off depth.**

10.4. **Allowable load carrying capacity** of pile corresponding to the length and diameter of pile shall be read from the tables below:

10.4.1. For Pile diameter = 1000 mm

10.5. Liquefaction Potential: All the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. Out of which several boreholes show the potential at various depths mentioned in the table below:

Bore No.	Liquefiable depth zone (meter)
P41	Top 1.00 & 5.00 to 6.00
P42	6.00 to 9.00
P43	Top 1.00 & 3.00 to 5.00
P44	Top 1.00 & 2.00 to 3.00
P45	4.00 to 5.00
P46	Top 9.00
P47	Top 1.00 & 2.00 to 3.00
P48	Top 1.00, 2.00 to 3.00 & 6.00 to 10.00
P49	Top 1.00, 3.00 to 4.00, 7.00 to 8.00 & 9.00 to 10.00
P50	Top 1.00 & 3.00 to 5.00
P51	Top 5.00
P52	Top 9.00 & 11.00 to 12.00
P53	Top 6.00
P54	Top 6.00
P55	Top 6.00 & 9.00 to 10.00
P56	Top 8.00
P57	Top 6.00
P58	Top 2.00 & 3.00 to 4.00
P59	Top 4.00 & 7.00 to 8.00
P60	Top 2.00 & 5.00 to 6.00

10.6. Type of cement to be used: No harmful chemicals are found within the soils. So, Ordinary Portland Cement or Portland Pozzolana Cement may be used for all civil constructions.

ACKNOWLEDGEMENTS

We are pleased to submit the part-4 of the report of Geotechnical investigation, conducted for the boreholes P61 to P80 for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)
B.Tech. (Civil), M.Tech.
Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -4 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers P61 to P80.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15’ N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

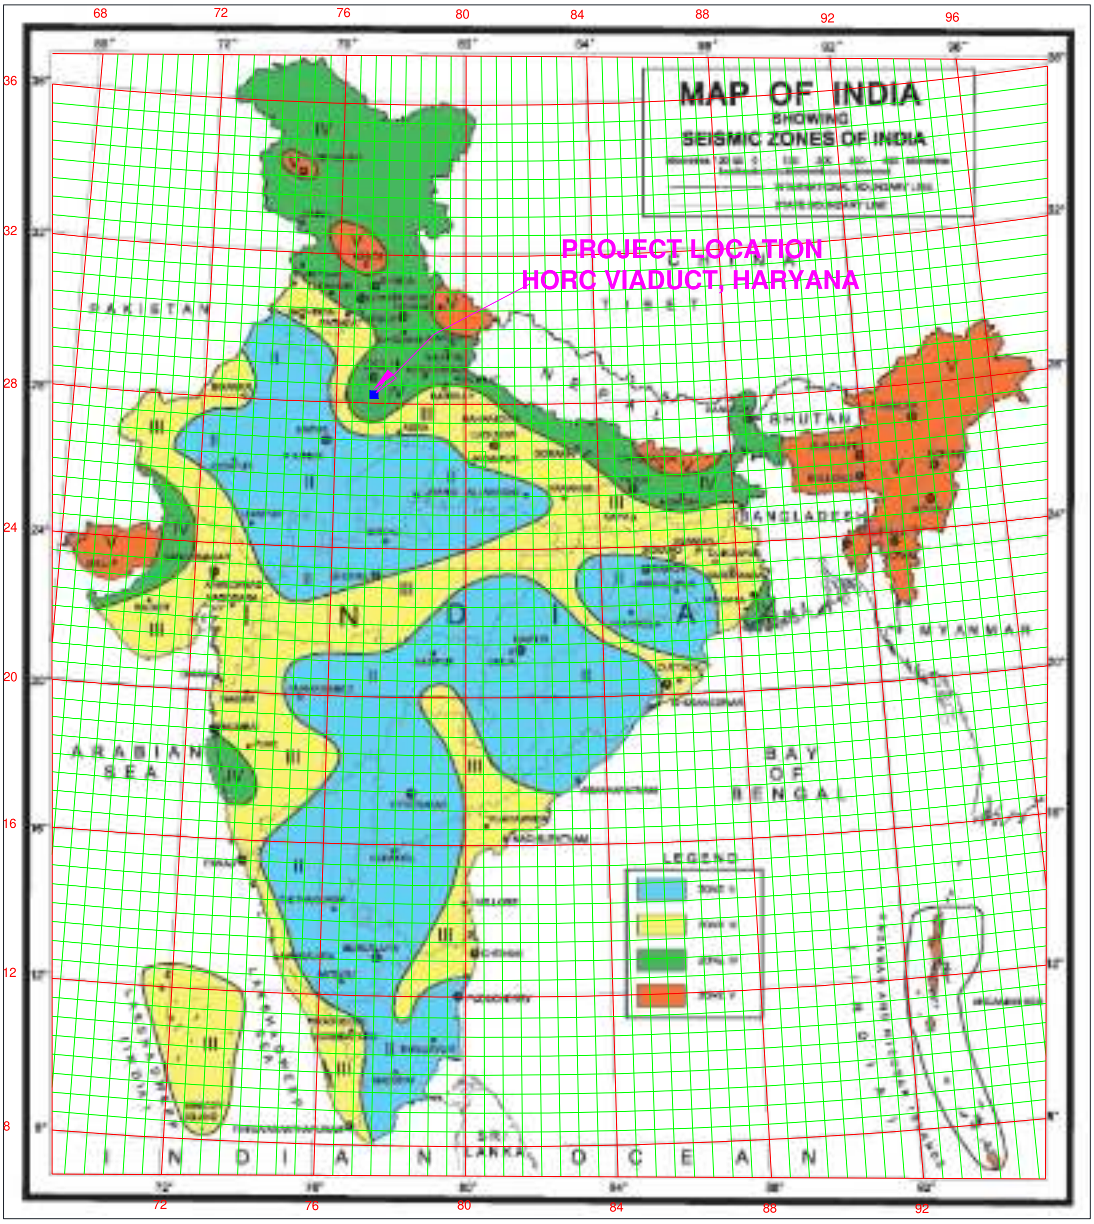

Fig.1: Seismic Zone Map of India

4. FIELD INVESTIGATION:

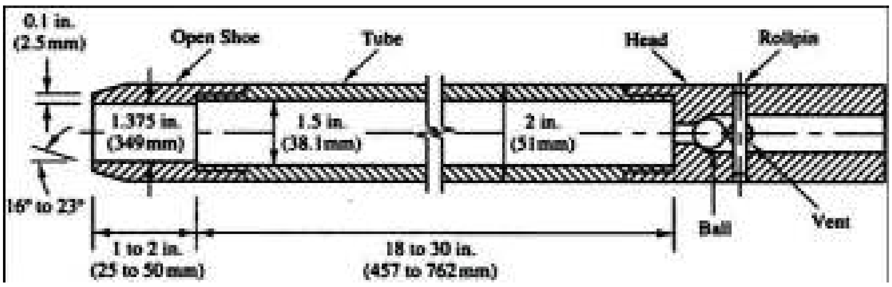
The field investigation work at this site was carried out from Sep 27th; 2023 to Oct 09th; 2023, Oct 21st; 2023 to Oct 24th; 2023 & Nov 03rd; 2023 to Nov 07th;

2023. The following investigation work was carried out:

4.1. **Twenty number** of **boreholes** (marked as P61 to P80) of diameter 150 mm in soil were made within the proposed alignment for conducting Standard Penetration Test and collection of disturbed and undisturbed samples. The boreholes were progressed using power operated winch and hydraulic rig machine under **percussion** and **rotary** method of drilling respectively. Casing was used to keep the borehole stable, and Bentonite was also used as drilling mud to help prevent wall collapse of boreholes at deeper depth. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in "TEST LOCATION PLAN" in Appendix A.

4.2. **Standard Penetration Tests** were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **auto-trip and rope-pulley driven hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is

termed the penetration resistance N. The N' values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		Correlation For Sand/Non-Plastic Silt	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 50 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77x \log(2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 to 20 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. **Disturbed soil samples** were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 to 20 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. **Undisturbed soil samples** were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness

of not less than 25 mm. The laboratory test results have been reported in Table 1 to 20 of Appendix-B.

4.5. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.6. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.5. **Atterbergs' limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) -1980-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.7. **Consolidation tests** were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.8. **Direct shear tests** were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.9. **Tri-axial Compression Test** under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.10. **Unconfined Compressive strength tests** were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 23 of Appendix B

5.11. **Shrinkage Limit tests** were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.12. **Free Swell Index** were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.13. **Chemical analysis on soil samples** was performed in accordance with IS: 2720 (Part-XXVI)-1987-(RA: 2021) for pH value, IS: 2720 (Part-XXVII)-1977-(RA: 2020) for Sulphate & BS:1377-3-2018 for chlorides and results have been reported in Table 21 "CHEMICAL TEST ON SOIL SAMPLES" of Appendix B.

5.14. **Chemical analysis on Ground Water sample** was performed in accordance with IS: 3025 (Part-XI)-2022 for pH value, IS: 3025 (Part-XXIV: Sec-1)-2022 for Sulphate & IS: 3025-(Part-XXXII)-1988-(RA: 2019) for chlorides and results have been reported in

Table 22 "CHEMICAL TEST ON GROUND WATER SAMPLES" of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P61	22514.0870	701210.312	3119493.892	191.635	40.00	1.52

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS:

13365-1. The detailed nature of the strata has been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in all the bore hole, is predominantly comprising of inorganic silty clays of low plasticity and inorganic silts of non to low plastic category. Silty sands were encountered at variable depth and thickness in all of the boreholes. Inorganic silts and clays of intermediate plasticity were also found at varying depths and thickness in some of the boreholes. Some lenses of silty sands with clay binders were found as exception in some of the borehole such as P72, P75, etc.

8. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation **(Bored Cast-In-Situ RCC piles)** have been considered for computation of load bearing capacity of the underlying soil strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020) with due consideration of effects of liquefaction.

8.1. Design Parameters:

Factor of safety in Compression	=	2.50
Factor of safety in Tension	=	3.00
Depth of critical water table	=	0.00 m
Diameter of pile	=	1.00 & 1.20 m
Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

8.2. Computation of friction along pile stem:

$$Q_{uf} = \sum K_i.P_{di}.\tan\delta_i.A_{si}$$

where,

Q_{uf} = Ultimate shaft friction (kN/m^2)

K_i = Coefficient of earth pressure at mid-depth of ith layer

P_{di} = Effective overburden pressure at mid-depth of ith layer (kN/m^2)

A_{si} = Surface area of pile stem in ith layer (m^2)

δ_i = Angle of wall friction between pile and soil of i^{th} layer (= ϕ) (degree)

ϕ_i = Angle of internal friction of soil in i^{th} layer (degree)

Σ = Sum of all layers up to i^{th} layer

8.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \Sigma \alpha_i . c_i . A_{si}$

Where,

c_i = Cohesion in i^{th} layer

A_{si} = Surface area of pile stem in i^{th} layer (m^2)

α_i = Adhesion factor for i^{th} layer of soil depending of consistency of soils

Σ = Sum of cohesion of all layers considered

8.4. Computation of end bearing resistance:

Q_{ub} = A_p (c.Nc + q.Nq + 0.5. γ.B.Nγ)

Where,

A_p = Area of the pile toe (m^2)

c = cohesion of soils at pile toe (kN/m^2)

γ = Effective Unit weight of soils at pile toe (kN/m^3)

B = Diameter of pile (m)

q = Effective overburden pressure at pile toe (kN/m^2)

N_c = Bearing Capacity Factor (Recommended equal to 9)

Nq, Nγ = Bearing Capacity Factor

8.5. Lateral load capacity of piles in soils:

$Q_u = 12.E.I.\delta/(L_1+L_f)^3$

where,

Q_u = Ultimate lateral load capacity of pile (kN)

δ = Permissible deflection (m) = 5 mm

E = Young Modulus of pile material (kN/m^2)

I	=	Moment of Inertia of the pile cross section (m^4)
L_1	=	Cantilever Length of pile (m)
L_f	=	Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-1 to 2** of **Appendix-H.**

Pile lateral Load capacity has been given in **Table-3 to 4** of **Appendix-H**.

9. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations.

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (Energy correction factor)

Design Earthquake Base:

Earthquake zone	= IV
Magnitude of earthquake	= 7
Seismic Zone factor	= 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

$<$ 1.00 : Stratum is to be considered as liquefiable

$>$ 1.20 : Non-Liquefiable

The detailed calculations of liquefaction have been reported in **Table-5** of **Appendix-H.**

10. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

10.1. **Bored Cast-In-Situ RCC Piles** of diameter 1000 and 1200 mm have been adopted for SBC computations of foundation for Viaduct.

10.2. **Cut off length** of piles have been considered as 2.50 m from the existing ground level for the purpose of computation of SBC.

10.3. **Pile length** recommended in the table below, shall be measured **after the cut-off depth.**

10.4. **Allowable load carrying capacity** of pile corresponding to the length and diameter of pile shall be read from the tables below:

10.4.1. For Pile diameter = 1000 mm

10.5. Liquefaction Potential: All the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. Out of which several boreholes show the potential at various depths mentioned in the table below:

Bore No.	Liquefiable depth zone (meter)
P61	Top 1.00 & 8.00 to 9.00
P62	Top 1.00
P63	Top 1.00
P64	Top 1.00 & 2.00 to 3.00
P65	Top 1.00, 2.00 to 3.00 & 4.00 to 5.00
P66	3.00 to 4.00 & 7.00 to 8.00
P67	Top 1.00 & 3.00 to 6.00

Bore No.	Liquefiable depth zone (meter)
P68	Top 1.00 & 2.00 to 3.00
P69	Top 1.00 & 2.00 to 3.00
P70	Top 1.00 & 4.00 to 9.00
P71	Top 2.00 & 5.00 to 9.00
P72	2.00 to 4.00 & 9.00 to 10.00
P73	Top 1.00 & 9.00 to 10.00
P74	Top 1.00, 2.00 to 3.00 & 14.00 to 15.50
P75	Top 1.00 & 2.00 to 3.00
P76	Top 2.00
P77	Top 2.00
P78	Top 3.00 & 4.00 to 6.00
P79	Top 1.00
P80	3.00 to 5.00

10.6. Type of cement to be used: Chemical content in the soil samples is slightly higher but still within the permissible limits. So, Ordinary Portland Cement or Portland Pozzolana Cement may be used for all civil constructions.
