Section VII-8: Tender Drawings and Documents

A- Tender Drawings
B- Documents

Note: Tenderer shall download Section VII-8: Tender Drawings and Documents from HRIDC website. Section VII-8: Tender Drawings and Documents are available for downloading under Active Tender Section on HRIDC website (https://hridc.co.in/active-tender.php). Section VII-8: Tender Drawings and Documents uploaded on HRIDC website for Package C-5 shall be deemed to form part of Tender Documents. List of Tender Drawings and Documents are enclosed hereunder.

Section VII-8A
Tender Drawings

Tenderer shall download Section VII-8: Tender Drawings and Documents from HRIDC website. Section VII-8: Tender Drawings and Documents are available for downloading under Active Tender Section on HRIDC website (https://hridc.co.in/active-tender.php). Section VII-8: Tender Drawings and Documents uploaded on HRIDC website for Package C-5 shall be deemed to form part of Tender Documents. List of Tender Drawings are enclosed hereunder.

	- **Black colour shows Tender drawings which have not been revised**
	- **Blue colour shows Tender drawings which have been revised**
	- **Red colour shows New additional Tender drawings**

List of Tender Drawings
I. Civil Drawings

S. No	TITLE	DRAWING NO.
1. ALIGNMENT PLAN & L-SECTION		
1.	Conceptual Plan & longitudinal section (-2.296KM to -0.6KM)	GC-HRIDC-ALL-DRW-ALN-P&P-(-2.296) - (-0.6) KM_A0
2.	Conceptual Plan & longitudinal section (-0.6 KM TO 0.0 KM)	GC-HRIDC-ALL-DRW-ALN-P&P-(-0.6) - (0.0) KM_A0
3.	Conceptual Plan & longitudinal section (0.0 KM TO 5.0 KM)	GC-HRIDC-ALL-DRW-ALN-P&P-0-5KM_A1
4.	Conceptual Plan & longitudinal section (5.0 KM TO 10.0 KM)	GC-HRIDC-ALL-DRW-ALN-P&P-5-10KM_A0
5.	Conceptual Plan and longitudinal section (10.0KM to 15.0KM)	GC-HRIDC-ALL-DRW-ALN-P&P-10-15KM_A2
6.	Conceptual Plan and longitudinal section (15.0KM to 20.0KM)	GC-HRIDC-ALL-DRW-ALN-P&P-15-20KM_A2
7.	Conceptual Plan & longitudinal section (20.0 KM TO 25.0 KM)	GC-HRIDC-ALL-DRW-ALN-P&P-20-25KM_A1
2. ESP/YARD PLAN		
1.	Detailed Design Yard Layout Plan for New Prithala Junction Station.	14YLPLT4103 Rev 2 dated 22.09.2023
2.	Conceptual Engineering Scale Plan Prithla Junction Yard Ch:00m F/Prithla	GC-HRIDC-C5-DRW-STN-ESP-PRI01_A0
3.	Conceptual Engineering Scale Plan Silani Station Yard CH:10341.882m F/Prithla	GC-HRIDC-C5-DRW-STN-ESP-SIL01_A0
4.	Conceptual Engineering Scale Plan IMT Sohna	GC-HRIDC-C5-DRW-STN-ESP-SOH01_A1
3. STATION BUILDING AND SUBWAY		
1.	Conceptual Plan of Prithla Station & Subway No. 8 & 8A	GC-HRIDC-C5-DRW-STN-SAD-PRI01_A0 (Sheet 1 of 3)

S. No	TITLE	DRAWING NO.
	Conceptual Architectural Drawing Prithla Station Building	GC-HRIDC-C5-DRW-STN-SAD-PRI01_A1 (Sheet 2 of 3)
	Conceptual Architectural Drawing Prithla Building	GC-HRIDC-C5-DRW-STN-SAD-PRI01_A1 (Sheet 3 of 3)
2.	Conceptual Plan of SILANI Station and Subway No. 39 & 39A	GC-HRIDC-C5-DRW-STN-SAD-SIL01_A0 (Sheet 1 of 1)
3.	Conceptual Plan of Sohna Station and Subway No. 66 & 66A	GC-HRIDC-C5-DRW-STN-SAD-SOH01_A0 (Sheet 1 of 3)
	Conceptual Architectural Drawing IMT Sohna Station Building	GC-HRIDC-C5-DRW-STN-SAD-SOH01_A1 (Sheet 2 of 3)
		GC-HRIDC-C5-DRW-STN-SAD-SOH01_A1 (Sheet 3 of 3)
4. BRIDGES		
4.1	**MINOR BRIDGES**	
4.1.1	**MAIN LINE**	
1.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No.6 1x 2x 2m RCC Box at Ch.-574.471	GC-HRIDC-C5-DRW-BRD-GAD_01006_A0
2.	Conceptual General Arrangement Drawing For Road Under Bridge No. 07, Span 1.0x4.6x5.65 RCC Box at Ch:-252.537	GC-HRIDC-C5-DRW-BRD-GAD_01007_A0
3.	Conceptual General Arrangement Drawing For Road Under Bridge No. 09 Span 1.0x4.6x4.15 RCC Box at Ch:139.953	GC-HRIDC-C5-DRW-BRD-GAD_01009_A0
4.	Conceptual General Arrangement Drawing For Balancing Culvert + RUB Bridge No. 10 Span 1x5.2x5.0 + 1x4.7x5 RCC Box at Ch: 371.033 (CANAL CROSSING DHATIR DISTRIBUTORY RD 25000)	GC-HRIDC-C5-DRW-BRD-GAD_010010_A1
5.	Conceptual General Arrangement Drawing For Road Under Bridge No 11 Span 1x4.6x4.15 RCC Box at Ch: 958.395	GC-HRIDC-C5-DRW-BRD-GAD_01011_A0
6.	Conceptual General Arrangement Drawing For Road Under Bridge No 13 Span 1x4.60x4.15, RCC box at Ch: 2034.968	GC-HRIDC-C5-DRW-BRD-GAD-01013_A0
7.	Conceptual General Arrangement Drawing For RUB + Balancing Culvert Bridge No. 14 Span 2x5.2x4.15 RCC Box at Ch: 2493.015 (CANAL CROSSING CHANDPUR MINOR RD 6500)	GC-HRIDC-C5-DRW-BRD-GAD_01014_A1
8.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 15 Span 1x2x2 RCC Box at Ch: 3153.203	GC-HRIDC-C5-DRW-BRD-GAD_01015_A0
9.	Conceptual General Arrangement Drawing For Road Under Bridge No. 18	GC-HRIDC-C5-DRW-BRD-GAD_01018_A0

S. No	TITLE	DRAWING NO.
	1x9.75mx6.70m RCC Box at Ch.4373.615m	
10.	Conceptual General Arrangement Drawing For Road Under Bridge No 19 Span 1.0x4.6x4.15 RCC Box at Ch: 4858.791	GC-HRIDC-C5-DRW-BRD-GAD-01019_A1
11.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No 20 Span 1x2.0x2.0 RCC Box at Ch.4891.994	GC-HRIDC-C5-DRW-BRD-GAD-01020_A1
12.	Conceptual General Arrangement Drawing For Road Under Bridge No. 21 1 x 4.6 x 4.15m RCC Box at Ch.5340.10m	GC-HRIDC-C5-DRW-BRD-GAD_01021_A0
13.	Conceptual General Arrangement Drawing For Road Under Bridge No. 22 1x 4.6 x 4.15m RCC Box at Ch.5807.675m	GC-HRIDC-C5-DRW-BRD-GAD_01022_A0
14.	Conceptual General Arrangement Drawing For Balancing Culvert No. 23 1x 3 x 3m RCC Box at Ch.6409.986m	GC-HRIDC-C5-DRW-BRD-GAD_0023_A0
15.	Conceptual General Arrangement Drawing For Road Under Bridge No. 24 1x 4.6 x 4.150 m RCC Box at Ch.6881.539m	GC-HRIDC-C5-DRW-BRD-GAD_01024_A0
16.	Conceptual General Arrangement Drawing For Road Under Bridge No 25 Span 1.0x4.60x4.50 RCC Box at Ch: 7548.737	GC-HRIDC-C5-DRW-BRD-GAD-01025_A0
17.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 27 Span 1x2x2 RCC Box at Ch: 7941.374	GC-HRIDC-C5-DRW-BRD-GAD_01027_A0
18.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 29 Span 1x2x2 RCC Box at Ch: 8141.419	GC-HRIDC-C5-DRW-BRD-GAD_01029_A0
19.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 31, 1 x 4 x 3.0m RCC Box at Ch.8593.734m	GC-HRIDC-C5-DRW-BRD-GAD_01031_A1
20.	Conceptual General Arrangement Drawing For Balancing Culvert No. 32 1x4.0x3.7m RCC Box at Ch: 8891.591m	GC-HRIDC-C5-DRW-BRD-GAD_01032_A0
21.	Conceptual General Arrangement Drawing For Road Under Bridge No. 33 1 x 7.00 x 4.15m RCC Box at Ch.9293.620m	GC-HRIDC-C5-DRW-BRD-GAD_01033_A0
22.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 35 Span 1x2x2 RCC Box at Ch: 9591.677	GC-HRIDC-C5-DRW-BRD-GAD_01035_A0
23.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 36 Span 1x2x2 RCC Box at Ch: 9882.453	GC-HRIDC-C5-DRW-BRD-GAD_01036_A0
24.	Conceptual General Arrangement Drawing For Road Under Bridge No. 37 1 x 5.70 x 4.15m RCC Box at Ch.9894.460m	GC-HRIDC-C5-DRW-BRD-GAD_01037_A0

S. No	TITLE	DRAWING NO.
25.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 38 Span 1x3x3 RCC Box at Ch: 10090.792	GC-HRIDC-C5-DRW-BRD-GAD_01038_A1
26.	Conceptual General Arrangement Drawing For Road Under Bridge No. 40 Span 1x8.40x5.15 RCC Box at Ch: 10410.702	GC-HRIDC-C5-DRW-BRD-GAD_01040_A1
27.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 42 Span 1x2x2 RCC Box at Ch: 10907.894	GC-HRIDC-C5-DRW-BRD-GAD_01042_A0
28.	Conceptual General Arrangement Drawing For Road Under Bridge No. 43 Span 1.0x4.70x5.65 RCC Box at Ch: 11203.249	GC-HRIDC-C5-DRW-BRD-GAD_01043_A0
29.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 44 Span 1x2.0x2.0 RCC Box at Ch: 11403.443	GC-HRIDC-C5-DRW-BRD-GAD_01044_A1
30.	Conceptual General Arrangement Drawing For Road Under Bridge No. 64 Span 2x6.0x4.0 RCC Box at Ch: 18558.00	GC-HRIDC-C5-DRW-BRD-GAD_01064_A1
31.	Conceptual General Arrangement Drawing For Balancing Culvert Bridge No. 65 Span 1x2x2 RCC Box at Ch: 18735.000	GC-HRIDC-C5-DRW-BRD-GAD_01065_A0
32.	Conceptual General Arrangement Drawing For Road + Balancing Culvert No. 67 Span 2.0x7.5x7.5 RCC Box at Ch: 19435.000 (CANAL CROSSING REWASAN DRAIN RD 10350)	GC-HRIDC-C5-DRW-BRD-GAD-01067_A1
4.1.2	**CONNECTING LINE**	
A. PRITHLA TO NEW PRITHLA		
1.	Conceptual General Arrangement Drawing For Pipe Culvert Bridge No. 1 1x1.2m Dia ,at Ch:-1950.000	GC-HRIDC-C5-DRW-BRD-GAD_01001_A0
2.	Conceptual General Arrangement Drawing For Balancing Culvert + RUB Bridge No. 02 Span 1x2.5x5.05+1x3.6x5.05, RCC Box, at Ch: -1832.759	GC-HRIDC-C5-DRW-BRD-GAD_01002_A1
3.	Conceptual General Arrangement Drawing For Road Under Bridge No. 03, Span 1.0x4.60x5.65 RCC Box at Ch: -1312.056	GC-HRIDC-C5-DRW-BRD-GAD_01003_A0
4.2	**MAJOR BRIDGES**	
4.2.1	**MAIN LINE**	
1.	Conceptual General Arrangement Drawing for Prop Canal Crossing Bridge No. 4,	GC-HRIDC-C5-DRW-BRD-GAD_01004_A0

S. No	TITLE	DRAWING NO.
	1x8x7.5+1x24.4+1x8x7.5m (CG+ RCC Box) at Ch. -795.733	
2.	Conceptual General Arrangement Drawing for Road No. 5, 1x 12 x 6.10m RCC Box at Ch. -592.612m	GC-HRIDC-C5-DRW-BRD-GAD_01005_A0
3.	Conceptual General Arrangement Drawing Proposed RUB Bridge No.12 1x12.2 PSC U Slab Ch:1696.624	GC-HRIDC-C5-DRW-BRD-GAD_01012_A0
4.	Conceptual General Arrangement Drawing Proposed Major Bridge No. 16 1x12x6.10 m, RCC box Ch: 3472.548m	GC-HRIDC-C5-DRW-BRD-GAD_01016_A0
5.	Conceptual General Arrangement Drawing for Proposed Major RUB No.17 4x30.5 Open web Girder at Ch:4256.298m (NH-148A DND-2)	GC-HRIDC-C5-DRG-BRD-GAD_00017_A0 (Sheet 1 of 2)
		GC-HRIDC-C5-DRG-BRD-GAD_00017_A0 (Sheet 2 of 2)
6.	Conceptual General Arrangement Drawing Proposed RUB Bridge No. 26 1x12x6.10 m, RCC Box Ch: 7753.296m	GC-HRIDC-C5-DRW-BRD-GAD_01026_A0
7.	Conceptual General Arrangement Drawing For Prop. Major Bridge No. 28 18.3X30.5+18.3(OWG+CG) AT CH: 8036.354m (CANAL CROSSING GURGAON CANAL RD 79150)	GC-HRIDC-C5-DRG-BRD-GAD_01028_A0
8.	Conceptual General Arrangement Drawing For Prop. Drain Crossing Bridge No.30, 1X30.5 (Composite Girder) AT CH: 8298.110m (CANAL CROSSING NUH DRAIN RD 87645)	GC-HRIDC-C5-DRG-BRD-GAD_01030_A0
9.	Conceptual General Arrangement Drawing Proposed IOCL Crossing Bridge No. 34 1 x24.4m (CG) AT CH.9536.901m	GC-HRIDC-C5-DRW-BRD-GAD_01034_A0
10.	Conceptual General Arrangement Drawing for Road Under Bridge no. 41 Span 1x12x5.650 RCC Box at Ch: 10709.675	GC-HRIDC-C5-DRW-BRD-GAD_01041_A0
11.	Conceptual General Arrangement Drawing for Prop. Major Bridge No.045, at Ch: 11543.518m 2X76.2 (Open Web Girder) (NH 919 PALWAL SOHNA ROAD)	GC-HRIDC-C5-DRW-BRD-GAD_01045_A0
12.	Conceptual General Arrangement Drawing For Stream Bridge No.53 2x24.4 m CG at Ch:14472.112	GC-HRIDC-C4-DRW-BRD-GAD_01053_A2

S. No	TITLE	DRAWING NO.
13.	Conceptual General Arrangement Drawing for Prop. Drain Crossing bridge no.63 1x5x4.9+1x12.2m+1x5x4.9 (PSC U Slab +RCC Box) at CH: 18310 (CANAL CROSSING INDRI DISTRIBUTARY RD 11260)	GC-HRIDC-C5-DRW-BRD-GAD_01063_A0
14.	Conceptual General Arrangement Drawing for Prop. Major RUB No.68 2x61(OWG) at Ch: 20184 (CANAL CROSSING REWASAN DRAIN RD 6670) NH-248A	GC-HRIDC-C5-DRG-BRD-GAD_01068_A0
15.	Conceptual General Arrangement Drawing for Prop. Major Bridge no.69 12.2+2X18.3+12.2 (CG+PSC U Slab) at Ch: 20400m	GC-HRIDC-C5-DRG-BRD-GAD_01069_A0
16.	Conceptual General Arrangement Drawing for Viaduct Br. No.70, Span: 105X24.4+1X30.5+41x24.4 +1x30+1x11.10 (Composite Girder) from Ch: 20942.473m to 24843.543m	GC-HRIDC-C5-DRG-BRD-GAD_01070_A0 (Sheet 1 of 15 to 15 of 15)
		GC-HRIDC-C5-DRG-BRD-GAD_01070_A0 (Sheet 2 of 15)

		GC-HRIDC-C5-DRG-BRD-GAD_01070_A0 (Sheet 11 of 15)
		GC-HRIDC-C5-DRG-BRD-GAD_01070_A0 (Sheet 12 of 15)
		GC-HRIDC-C5-DRG-BRD-GAD_01070_A0 (Sheet 13 of 15)
		GC-HRIDC-C5-DRG-BRD-GAD_01070_A0 (Sheet 14 of 15)
		GC-HRIDC-C5-DRG-BRD-GAD_01070_A0 (Sheet 15 of 15)

S. No	TITLE	DRAWING NO.
5. MISCELLANEOUS DRAWINGS (CONCEPTUAL PLANS)		
1.	Conceptual Plan Typical Embankment/Cutting Profile	GC-HRIDC-SK-GEN-001_A1
2.	Conceptual Plan Mini Platform Shelter	GC-HRIDC-SK-GEN-003
3.	Conceptual Plan R.C. Pre-Cast Fencing for End Platform	GC-HRIDC-SK-GEN-004
4.	Conceptual Plan Station Name Board	GC-HRIDC-SK-GEN-005
5.	Conceptual Plan Proposed Toilet Block on End Platforms	GC-HRIDC-SK-GEN-007_A1
6.	Conceptual Plan Drains for Embankment	GC-HRIDC-SK-GEN-008_A1
7.	Conceptual Plan Steel Barricade	GC-HRIDC-SK-GEN-009
8.	Conceptual Plan Water Booth with One Side Taps Arrangement (End Platform)	GC-HRIDC-SK-GEN-010_A1
9.	Conceptual Plan Water Booth with Both Side Taps Arrangement (Island Platform)	GC-HRIDC-SK-GEN-011_A1
10.	Conceptual Plan of Auto Location Hut (S&T)	GC-HRIDC-SK-GEN-012_A1
11.	Conceptual Plan Ticket Counter	GC-HRIDC-SK-GEN-013
12.	Conceptual Plan CC Toe Wall	GC-HRIDC-SK-GEN-014_A1
13.	Conceptual Plan Typical Details of Protection Work of Bridge Approaches	GC-HRIDC-SK-GEN-015_A1
14.	Conceptual Plan Barbed Wire Fencing	GC-HRIDC-SK-GEN-016_A1
15.	Conceptual Plan RCC Duct of Signalling Cable	GC-HRIDC-SK-GEN-017
16.	Conceptual Plan for Transition System of Bridge Approaches	GC-HRIDC-SK-GEN-019
17.	Conceptual Plan for Self-Supporting Roof Covering Shed	GC-HRIDC-SK-GEN-020
18.	Conceptual Plan for Formation Details Below of Subway and Lift Well	GC-HRIDC-SK-GEN-021
19.	Conceptual Plan for Trolley Refuge in Embankment	GC-HRIDC-SK-GEN-022
20.	Conceptual Plan for Trolley Refuge in Cutting	GC-HRIDC-SK-GEN-023
21.	Conceptual Sketch for RCC Platform Wall	GC-HRIDC-SK-GEN-024
22.	Conceptual Plan for Single and Double Lane Road	GC-HRIDC-SK-GEN-025
23.	Conceptual Sketch for Reinforced Earth Wall with Geogrid Reinforcement	GC-HRIDC-SK-GEN-026
24.	Conceptual Plan OHE Portal for OWG Girder	GC-HRIDC-SK-GEN-035
25.	Conceptual Plan for Mild Steel Pipe 323.9mm Outer Dia for Future Utilities	GC-HRIDC-SK-GEN-030

S. No	TITLE	DRAWING NO.
26.	Jurisdictional Sketch Of C-5 Package	GC-HRIDC-C5-SK-CIVIL-001_A0
27.	Conceptual Plan Drainage Arrangement (Prithla)	GC-HRIDC-C5-SK-CIVIL-002_A1
28.	Conceptual Plan Drainage Arrangement (Silani)	GC-HRIDC-C5-SK-CIVIL-003_A1
29.	Conceptual Plan Drainage Arrangement (IMT Sohna)	GC-HRIDC-C5-SK-CIVIL-004_A1
30.	Conceptual Plan Bank/Cutting Benching at Interface Locations	GC-HRIDC-C5-SK-CIVIL-009_A0
31.	Type Plan Powder Toilet for Divyangs	N.R.H.Q.E PLAN NO. HQ/20/11-2021
32.	Conceptual Plan OWG With Concrete Deck for BLT	GC-HRIDC-SK-GEN-036
33.	Conceptual Plan Ground Improvement for Embankment at Pond/Water Logged Area.	GC-HRIDC-SK-GEN-037
34.	Conceptual Plan for OHE Earthing & OHE Bolt Fixing Arrangement on Bridges	GC-HRIDC- C5-SK-GEN-038
35.	Conceptual Plan Location of Signal Post for Composite Girder Bridges	GC-HRIDC-SK-GEN-034
36.	Conceptual Plan Location of OHE Mast In Viaduct	GC-HRIDC-SK-GEN-032
37.	Conceptual Plan Location of OHE Mast for Composite Girder Bridges	GC-HRIDC- SK-GEN-031
38.	Indicative OHE Guy Rod Arrangement on Viaduct	GC-HRIDC-SYS1-DRW-ELE-007_A0
39.	Conceptual Plan Typical Embankment/Cutting Profile	GC-HRIDC-SK-GEN-001_A1
40.	Conceptual Cross- sectional sketch of ALH	GC-HRIDC- SK-GEN-039_A0
41.	Conceptual Plan drains between HORC embankment & DFC	GC-HRIDC- SK-GEN-041_A0
42.	Conceptual Plan S&T hut	GC-HRIDC- SK-GEN-002_A0
43.	Typical Conceptual Cross-sectional sketch of Platform	GC-HRIDC- SK-GEN-042_A0
44.	Typical Cross section of Road in RUB (Minor bridge)	GC-HRIDC- SK-GEN-043_A0

II. General Electrical Services Drawings

S. No	TITLE	DRAWING NO.
1.	Indicative LT Supply System with Local, DG and Auxiliary Transformer Supply	GC-HRIDC-C5-DRW-ELE-001-A1
2.	Indicative LT Supply Distribution Diagram	GC-HRIDC-C5-DRW-ELE-002-A0
3.	Indicative Arrangement of Decorative Street Light Pole at Station and Platform	GC-HRIDC-C5-DRW-ELE-03-A1
4.	Indicative Cable Route Plan for Track Crossing of Power Cable and Route Marker	GC-HRIDC-C5-DRW-ELE-04-A0

5.	Indicative Earthing Arrangement of Electrical System by Copper Cladded Electrode	GC-HRIDC-C5-DRW-ELE-05-A0
6.	Indicative Schematic Drawing Of 11 KV Power Supply Arrangement	GC-HRIDC-C5-DRW-ELE-06-A0
7.	Indicative LT Supply System With Local & Auxilary Transformer Supply	GC-HRIDC-C5-DRW-ELE-007-A1
8.	Indicative Compact Substation (CSS) Single Line Diagram	GC-HRIDC-C5-DRW-ELE-08-A0
9.	Indicative Viaduct Lighting and Railing Earthing Arrangement	GC-HRIDC-C5-DRW-ELE-09-A0

III. Signalling & Telecommunication Drawings

S. No	TITLE	DRAWING NO.
1.	Typical Main Cable Distribution Plan for Double Line (4 Lines) P.I. Station	SDO/CABLE LAYING/001
2.	Position of Trenches for Cable Laying	SDO/CABLE LAYING/002
3.	Cable Trench	SDO/CABLE LAYING/003
4.	Laying Of Signalling Cable & Telecom/ Power Cable in Same Trench	SDO/CABLE LAYING/004
5.	Laying Of Cables in Rocky Area	NR/SIG/CABLE/004
6.	Track Crossings	NR/SIG/CABLE/005
7.	Road Crossings	NR/SIG/CABLE/006
8.	Cable Laying on Culverts with Low Flood Level	SDO/CABLE LAYING/011
9.	Cable Laying on Culverts with High Flood Level	NR/SIG/CABLE/007
10.	Cable Laying on Metallic Bridges	SDO/CABLE LAYING/013
11.	Cable Trough for Metallic Bridges	SDO/CABLE LAYING/014
12.	Cable Laying on Arch Bridges	NR/SIG/CABLE/008
13.	Brick Masonry Channel for Arch Bridge	SDO/CABLE LAYING/016
14.	Arrangement of Jumper cable	SDO/CABLE LAYING/017
15.	CI Cable Marker & Concreting	SDO/CABLE LAYING/018
16.	CI Cable Marker	SDO/CABLE LAYING/019
17.	Concrete Cable Marker	SDO/CABLE LAYING/020
18.	Method of Unrolling Cable	SDO/CABLE LAYING/021
19.	Rule Made of Pipe for Measuring Trench Depth	SDO/CABLE LAYING/022

Section VII-8B
Documents

Tenderer shall download Section VII-8: Tender Drawings and Documents from HRIDC website. Section VII-8: Tender Drawings and Documents are available for downloading under Active Tender Section on HRIDC website (https://hridc.co.in/active-tender.php). Section VII-8: Tender Drawings and Documents uploaded on HRIDC website for Package C-5 shall be deemed to form part of Tender Documents. List of Documents are enclosed hereunder.

	Black colour shows Documents which have not been revised
	Blue colour shows Documents which have been revised
	Red colour shows New additional Documents

R2 DATE 22.09.2023
NOTES FOR R2:-

... DFC UP Main Line no. 3A has been revised from 7m to 7.2m.
... and Common Loop Line no. 1B has been revised from 10.5m to 8.0m and length of Machine Siding has been revised from 300m to 200m, ...
... o. 13 and Common Loop Line no. 1B has been revised from 10.5m to 8.0m and length of Tower Wagon Siding has been revised from 150m to 100m ... dingly, DS and BS has been revised. Therefore now CSR of Common Loop Line No. 1B has been revised from 765m to 779.8m.
... d and lines of Prithala Container Handling Depot have been revised and are as below:
... o. 8B has been revised. Therefore now CSR of Goods Siding No. 8B has been revised from 860m to 871m.
... en revised from 280m to 120m and will be same as per REV 0, due to infringement of Signaling East Cabin at Ch: 94350.
... ined in Line no. 2 at Dadri End at Ch: 94734.956 and (BS at Ch: 94734.956m to be dismantled).
... ection and DFC UP Main Line will be 6.6m instead of 6.25m in REV 0.

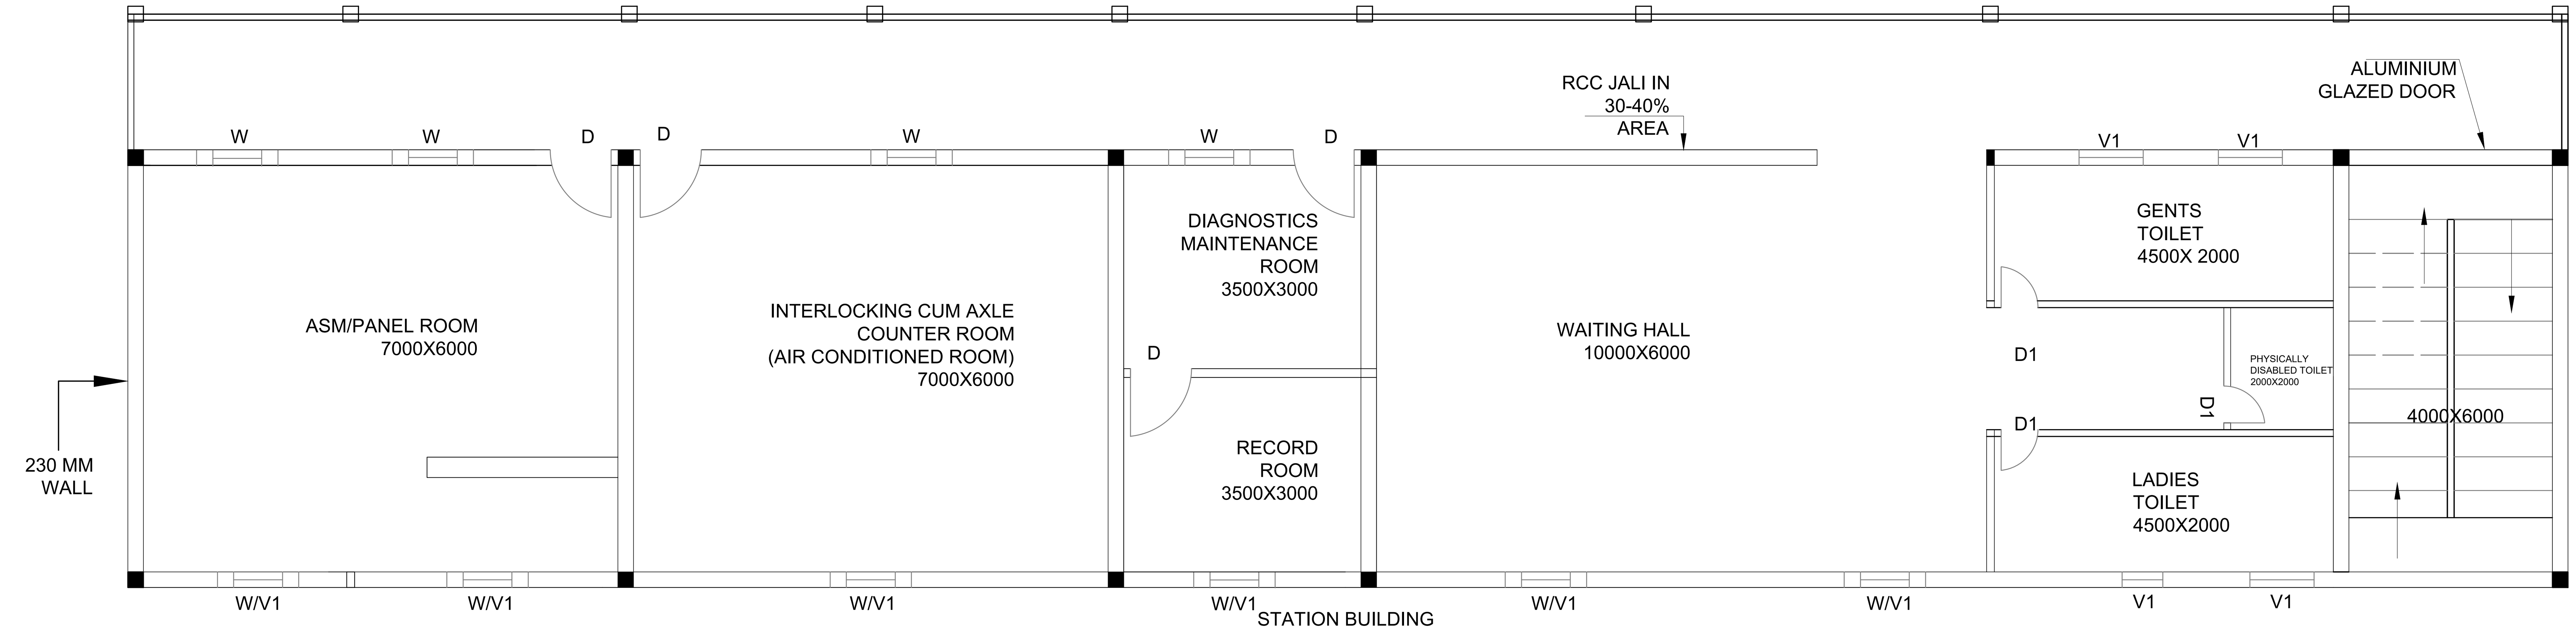
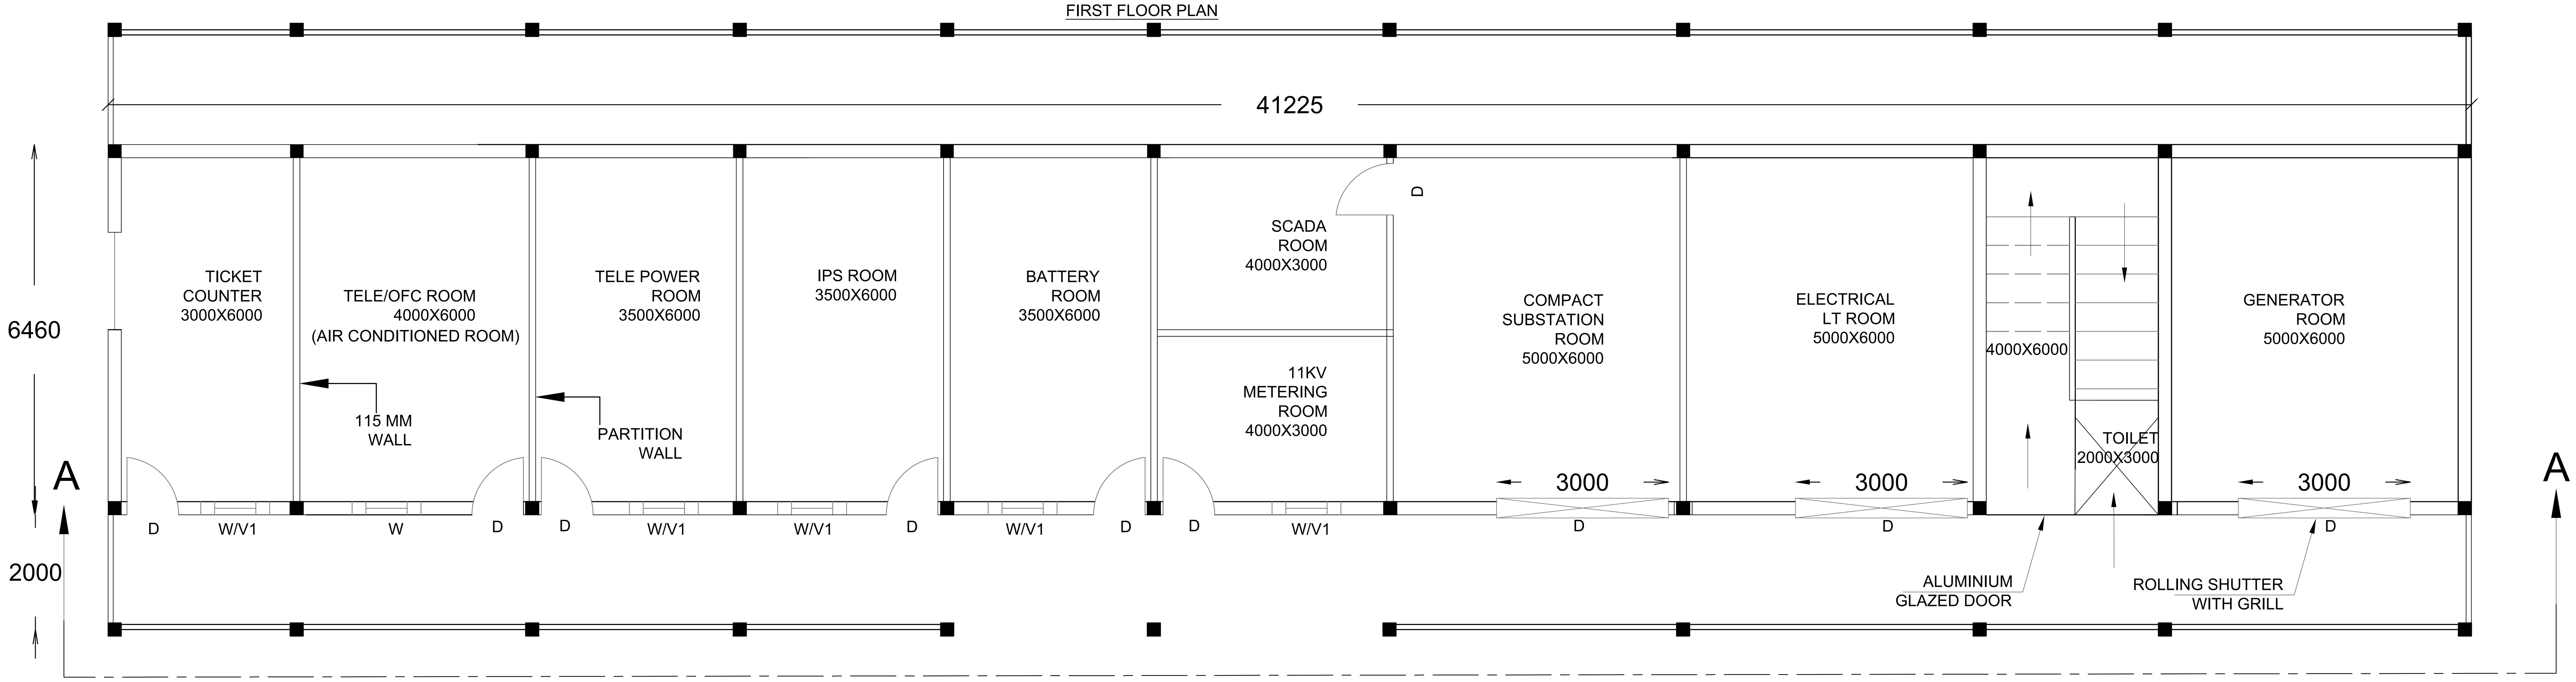
GC-HRIDC-C5-DRW-STN-SAD-SOH01_A0		
SCALE :	ISSUE DATE	REVISED DATE
NTS	27.09.2023	



STATION BUILDING
FIRST FLOOR PLAN



STATION BUILDING
GROUND FLOOR PLAN

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. ALL OUTERS WALLS ARE OF 230MM THICK & PARTITION WALLS ARE OF 115MM.
3. THE FLOOR LEVEL OF PANEL ROOM SHALL BE ABOUT 300 MM ABOVE PLATFORM LEVEL.
4. FOR ANY FURTHER DETAIL OF S&T SERVICE BUILDING REFER NR TYPE PLAN NO. O-99/2021 SHEET NO. 1 TO 5.
5. FOR PHYSICALLY HANDICAPPED TOILET REFER DRAWING NO. O-104/2021 SHEET 1 OF 1.
6. SUITABLE ARRANGEMENT FOR SEPTIC TANK & SOAK PIT TO BE PROVIDED.
7. DETAILING OF TICKET COUNTER SHALL BE AS PER SKETCH NO. GC-HRIDC-SK-GEN0-013.
8. STAINLESS STEEL HANDRAIL SHALL BE FIXED WITH WALLS IN STAIRCASE PORTION.
9. FOR DETAILING OF LADIES AND GENTS TOILETS REFER DRAWING NO. GC-HRIDC-SK-GEN-007.
10. HEAVY DUTY TWO RCC SHELF IN BATTERY ROOM ON TWO SIDES 1000MM WIDE FOR BATTERIES, 100MM PLINTH SHALL BE MADE BELOW SHELF. FIRST SHELF AT 1000MM & SECOND SHELF AT 1600MM FROM GROUND LEVEL.
11. POWER CABLE ENTRY 300mm(L)x300mm(H)x600mm DEEP IN POWER ROOM.
12. TELECOM/OFC CABLE ENTRY IN POWER ROOM 300mm(L)X300mm(H)X600mm DEEP.
13. HEAVY DUTY EXHAUST FAN IN IPS & BATTERY ROOM FRONT WALL WITH SELF CLOSING FLAP.

TYPE	OPENING SIZE		DESCRIPTION

NOTES :

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL, BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig)NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE.
   GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB-STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. ADEQUATE SLOPE IN BOTTOM SLAB OF RCC BOX TOWARDS DIRECTION OF FLOW SHALL BE PROVIDED.
2. GROUND IMPROVEMENT DEPTH SHALL BE AS PER DETAILED GT INVESTIGATION AND DESIGN REQUIREMENTS.

8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/Sig.NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES, DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD,

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.
3. ADEQUATE SLOPE IN BOTTOM SLAB OF RCC BOX TOWARDS DIRECTION OF FLOW SHALL BE PROVIDED.
4. RCC LINING SHALL BE CONSTRUCTED FOR CANAL FROM ROW TO ROW OF HORC INCLUDING IN RCC BOX & U-TROUGH.
5. RCC LINING SHALL BE OF MIN 150 MM THICK AND HAVING AT LEAST MIN TEMP REINFORCEMENT.

IMPORTANT NOTE:
TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

NOTES :

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL , BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig)NR,DFCCIL/ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD,

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.
17. DETAIL OF TOE WALL SHALL BE PROVIDED AS PER SKETCH NO. GC-HRIDC-SK-GEN-014_A1

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.

IMPORTANT NOTE:

TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB-STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.
3. REGRADING OF APPROACH ROAD HAS TO BE DONE ON OPPOSITE SIDE O DFC.

IMPORTANT NOTE:
TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

NOTES :

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL , BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig.)NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.
3. GROUND IMPROVEMENT DEPTH SHALL BE AS PER DETAILED GT INVESTIGATION AND DESIGN REQUIREMENTS.

IMPORTANT NOTE:

TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE. 13.THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. ADEQUATE SLOPE IN BOTTOM SLAB OF RCC BOX TOWARDS DIRECTION OF FLOW SHALL BE PROVIDED.
2. GROUND IMPROVEMENT DEPTH SHALL BE AS PER DETAILED GT INVESTIGATION AND DESIGN REQUIREMENTS.

NOTES :

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL, BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig)NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.
3. GROUND IMPROVEMENT DEPTH SHALL BE AS PER DETAILED GT INVESTIGATION AND DESIGN REQUIREMENTS.

IMPORTANT NOTE:
TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig)NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE.
   GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. ADEQUATE SLOPE IN BOTTOM SLAB OF RCC BOX TOWARDS DIRECTION OF FLOW SHALL BE PROVIDED.
2. WEARING COURSE PROFILE IN HORC BOX SHALL BE MAINTAINED WITH THAT OF DFC BOX. FOUNDING LEVEL OF BOX SHALL BE ADJUSTED ACCORDINGLY.
3. GROUND IMPROVEMENT DEPTH SHALL BE AS PER DETAILED GT INVESTIGATION AND DESIGN REQUIREMENTS.
4. CANAL IN HORC PORTION SHALL BE LINED FROM ROW TO ROW OF HORC INCLUDING IN RCC BOX & U-TROUGH.
5. RCC LINING SHALL BE OF MIN 150 MM THICK AND HAVING AT LEAST MIN TEMP REINFORCEMENT.

4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL, BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig)NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE.
   GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14 75MM DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.
3. GROUND IMPROVEMENT DEPTH SHALL BE AS PER DETAILED GT INVESTIGATION AND DESIGN REQUIREMENTS.

IMPORTANT NOTE:

TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL , BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/ (Sig.)/ NR, DFCCI ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD,

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. ADEQUATE SLOPE IN BOTTOM SLAB OF RCC BOX TOWARDS DIRECTION OF FLOW SHALL BE PROVIDED.

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL, BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig)NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.

IMPORTANT NOTE:

TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

NOTES :

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL , BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/Sig.NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.
3. ADEQUATE SLOPE IN BOTTOM SLAB OF RCC BOX TOWARDS DIRECTION OF FLOW SHALL BE PROVIDED.
4. RCC LINING SHALL BE CONSTRUCTED FOR CANAL FROM ROW TO ROW OF HORC INCLUDING IN RCC BOX & U-TROUGH.
5. RCC LINING SHALL BE OF MIN 150 MM THICK AND HAVING AT LEAST MIN TEMP REINFORCEMENT.

IMPORTANT NOTE:

TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL , BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
8. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE/OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/ (Sig.)/ NR, DFCCI ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
9. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
10. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
11. DETAILED GAD WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. STANDARD OF LOADING :- SUPER STRUCTURE-25T (RDSO STANDARD PSC U SLAB),& SUB STRUCTURE-32.5T- LOADING..
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   a. IRS BRIDGE RULE
   b. IRS CONCRETE BRIDGE CODE
   c. IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
   d. IS 2911 PART-1 SECTION-2.
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   a. ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   b. LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 30M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BRIDGE AFTER PROTECTION WORK.
9. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
10. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
11. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB-STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
12. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
13. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
14. THE STRUCTURAL DIMENSIONS AND SIZES ARE INDICATIVE AND THESE MAY VARY DURING DETAIL DESIGN.
15. SIZE, TYPE OF FOUNDATION & GROUND IMPROVEMENT DETAILS SHOWN ARE TENTATIVE AND MAY CHANGE DURING DETAILED DESIGN.
16. SEISMIC ARRESTOR SHALL BE PROVIDED ON THE PIER/ABUTMENT CAP.
17. DETAIL OF TOE WALL SHALL BE PROVIDED AS PER SKETCH NO. GC-HRIDC-SK-GEN-014_A1

C) OTHER NOTES :

1. FOR SUPERSTRUCTURE DETAILS FOLLOW RDSO DRG.NO'S : RDSO 10281,10281/1 AND 10281/2.
2. TRANSITION SYSTEM TO BE ADOPTED ON BRIDGE APPROACHES SHALL BE AS PER RDSO REPORT NO. GE:R-50(TRANSITION SYSTEM ON APPROACHES OF BRIDEGES). FOR DETAILS REFER SKETCH NO. GC-HRIDC-SK-GEN-019.
3. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
4. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.

CONSTRUCTION DEPTH

1) RAIL (60kg)	172 mm
2) RUBBER PAD	10 mm
3) WIDER PSC SLEEPER HEIGHT AT RAIL SEAT	210 mm
4) MINIMUM BALLAST THK.	350 mm
TOTAL	742 mm

NOTES :

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL, BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig)NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   (i) IRS BRIDGE RULE
   (ii) IRS CONCRETE BRIDGE CODE
   (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE.
   GRADE OF CONCRETE :
   (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
14. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.

IMPORTANT NOTE:

TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

NOTES :

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONCTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL , BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
8. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE/OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig.)/ NR, DFCCI ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
9. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
10. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
11. DETAILED GAD WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. STANDARD OF LOADING :- SUPER STRUCTURE-25.0T (RDSO STANDARD CG) & SUB STRUCTURE-32.5T- LOADING..
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   a. IRS BRIDGE RULE
   b. IRS CONCRETE BRIDGE CODE
   c. IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
   d. IS 2911 PART-1 SECTION-2.
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE.
   GRADE OF CONCRETE :
   a. ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   b. LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 30M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BRIDGE AFTER PROTECTION WORK.
9. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
10. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
11. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB- STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
12. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
13. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
14. THE STRUCTURAL DIMENSIONS AND SIZES ARE INDICATIVE AND THESE MAY VARY DURING DETAIL DESIGN.
15. SIZE, TYPE OF FOUNDATION & GROUND IMPROVEMENT DETAILS SHOWN ARE TENTATIVE AND MAY CHANGE DURING DETAILED DESIGN.
16. SEISMIC ARRESTOR SHALL BE PROVIDED ON THE PIER/ABUTMENT CAP.
17. DETAIL OF TOE WALL SHALL BE PROVIDED AS PER SKETCH NO. GC-HRIDC-SK-GEN-014_A1
18. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
19. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.

C) OTHER NOTES :

1. FOR SUPERSTRUCTURE DETAILS FOLLOW RDSO DWG. NO: RDSO/B-11754/R2 TO B-11754/6.
2. ARRANGEMENT FOR PATHWAY SHALL BE PROVIDED AS PER RDSO DWG. NO.CBS-0046(FOR CG) .
3. TRANSITION SYSTEM TO BE ADOPTED ON BRIDGE APPROACHES SHALL BE AS PER RDSO REPORT NO. GE:R-50(TRANSITION SYSTEM ON APPROACHES OF BRIDEGES). FOR DETAILS REFER SKETCH NO. GC-HRIDC-SK-GEN-019.
4. RCC LINING SHALL BE CONSTRUCTED FOR CANAL UPTO ROW OF HORC.
5. GROUND IMPROVEMENT DEPTH SHALL BE AS PER DETAILED GT INVESTIGATION AND DESIGN REQUIREMENTS.

4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL, BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. SUITABLE BED SLOPE SHALL BE PROVIDED AND ADJUSTED AS PER SITE CONDITIONS
8. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
9. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE /OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/(Sig)NR,DFCCIL ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
10. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
11. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
12. DETAILED DESIGN DRAWING WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. BOX BRIDGE IS TO BE DESIGNED FOR 32.5 T LOADING AS APPLICABLE.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   - (i) IRS BRIDGE RULE
   - (ii) IRS CONCRETE BRIDGE CODE
   - (iii) IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   - (i) ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   - (ii) LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 15M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BOX AFTER PROTECTION WORK.
9. FOR PROPER DRAINAGE OF WATER,SUITABLE SLOPE TO BE PROVIDED ON TOP OF BOX SLAB.
10. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL .
11. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
12. PLACEMENT LEVEL OF BOX AS SHOWN IN THIS GAD IS INDICATIVE AND MAY BE SUITABLY LOWERED/ELEVATED BASED UPON THE REQUIREMENT OF CLEARANCE, DRAINAGE &NATURAL GROUND PROFILE.
13. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB-STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °
14. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
15. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
16. THICKNESS OF STRUCTURAL MEMBERS ARE TENTATIVE AND WILL BE FINALISED AFTER DETAILED DESIGN.

C) OTHER NOTES :

1. HEIGHT GAUGE SHALL BE PROVIDE AS PER RDSO STANDARD DRAWING NO. RDSO/M0001.
2. SPEED BREAKER SHOULD BE PROVIDED ON EITHER APPROACH OF RUB AT A DISTANCE OF 20M FROM THE BRIDGE COVERING FULL WIDTH OF THE ROAD INCLUDE BERMS.
3. GROUND IMPROVEMENT DEPTH SHALL BE AS PER DETAILED GT INVESTIGATION AND DESIGN REQUIREMENTS.

IMPORTANT NOTE:

TOP OF BOTTOM SLAB OF RCC BOX SHALL NOT BE KEPT ABOVE THE NATURAL GROUND LEVEL.HOWEVER, ROAD LEVEL AND VERTICAL CLEARANCE ABOVE ROAD LEVEL SHALL BE MAINTAINED AS SHOWN IN THE DRAWING.OVERALL HEIGHT OF THE BOX MAY NEED MODIFICATION ACCORDINGLY.THE HEIGHT OF RCC BOX SHALL BE PROVIDED KEEPING ABOVE PROVISION IN VIEW.

   ii) IRS CONCRETE BRIDGE CODE 2014.
   iii) IRS BRIDGE RULES 2014.
   iv) IS 2911 PART-1 SECTION-2.
   v) EXPOSURE CONDITION - MODERATE.
   vi) SEISMIC ZONE - IV
   vii) STANDARD OF LOADING :- SUPER STRUCTURE-25T (RDSO STANDARD CG) & SUB STRUCTURE-32.5T- 2008 LOADING.
4. THE STRUCTURAL DIMENSIONS AND SIZES ARE INDICATIVE AND THESE MAY VARY DURING DETAIL DESIGN.
5. SIZE AND TYPE OF FOUNDATION SHOWN IS TENTATIVE AND MAY CHANGE DURING DETAILED DESIGN.
6. ALL RCC AND CC WORKS SHALL BE DONE IN ACCORDANCE WITH SPECIFICATION LAID DOWN IN IRS CONCRETE BRIDGE CODE.
7. THE GRADE OF CONCRETE
   i) FOR ABUTMENT,DIRT & RETURN WALLWEARING COURSE(WC)---------------M35
   ii) FOR FOUNDATION --M35
   iii) FOR LEVELING COURSE--M20
8. ALL CONCRETE WORK SHALL BE MECHANICALLY MIXED AND VIBRATED.
9. MIX DESIGN SHALL BE APPROVED BY ENGINEER - IN CHARGE.
10. HIGH YIELD STRENGTH DEFORMED BARS OF GRADE Fe-500D CONFORMING TO IS: 1786-2008 SHALL BE USED AS REINFORCEMENT.
11. BED LEVEL & ROAD LEVEL,FORMATION LEVEL AND RAIL LEVEL & ALIGNMENT SHALL BE VERIFIED BY THE ENGINEER AT SITE BEFORE EXECUTION OF WORK.
12. ANGLE OF INTERNAL FRICTION OF BACK FILL SHALL NOT BE LESS THAN 35.
13. PROTECTION WORK ON SLOPES OF BANK UP TO 30M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015.
14. BACK FILL BEHIND RETURN WALL/WING WALL SHALL BE AS PER CL.7.5 OF IRS BRIDGE SUBSTRUCTURE & FOUNDATION CODE 2013. BOULDER FILLING & BOULDER PACKING BEHIND RETURN WALL/WING WALL TO BE DONE AS PER IRS FOUNDATION & SUBSTRUCTURE CODE CL.7.5.2. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 KG/SQM.CONFORMING TO IS-3117.
15. CURING SHALL BE DONE AS PER CLAUSE NO 8.4 OF IRS CONCRETE BRIDGE CODE.
16. SAFETY & PROTECTION OF THE PROPOSED WORK IS TO BE ENSURED BY THE CONTRACTOR AS PER PARA 826 OF IRPWM WITH UPDATED CORRECTION SLIPS OF 2011-12.
17. THE SPECIFICATIONS FOR THE COMPOSITE GIRDER SHALL BE IN ACCORDANCE WITH RDSO DRG.NO'S : RDSO B-11751/R1 TO 11751/8.
18. CONCRETING SHALL BE DONE IN ACCORDANCE WITH IRS CONCRETE BRIDGE CODE WITH 20MM MAXIMUM SIZE AGGREGATE.
19. ALL DIMENSIONS AND LEVELS SHOULD BE VERIFIED AT SITE BEFORE EXECUTION.
20. BRIDGE DETAILS LIKE , DL, INSPECTION STEPS PAINTINGS ETC SHOULD BE FOLLOWED AS PER BRIDGE MANUAL, DURING CONSTRUCTION.
21. THIS DRAWING IS PROPERTY OF HARYANA RAIL INFRASTRUCTURE DEVELOPMENT CORPORATION LIMITED (HRIDC) AND EXCLUSIVE USE OF HRIDC.
22. ARRANGEMENT FOR PATHWAY SHALL BE PROVIDED AS PER RDSO DWG. NO. CBS-0046 (FOR CG).
23. SEISMIC ARRESTOR SHALL BE PROVIDED ON THE PIER/ABUTMENT CAP.
24. TRANSITION SYSTEM TO BE ADOPTED ON BRIDGE APPROACHES SHALL BE AS PER RDSO REPORT NO. GE:R-50(TRANSITION SYSTEM ON APPROACHES OF BRIDEGES). FOR DETAILS REFER SKETCH NO. GC-HRIDC-SK-GEN-019.

NOTES :

A) GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS EXCEPT LEVELS WHICH ARE IN METER, UNLESS OTHERWISE MENTIONED.
2. NO DIMENSION SHALL BE SCALED FROM THE DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
3. THE CHAINAGES SHOWN ARE RECKONED FROM C/L OF PRITHALA STATION BUILDING TAKEN AS 0.00 M, WITH RESPECT TO UP MAIN LINE.
4. FOR RAIL LEVELS, FORMATION LEVEL, GRADES ETC. REFER L-SECTION.
5. THE EXISTING DETAILS ARE AS PER PRELIMINARY SITE SURVEY AND SHALL BE VERIFIED BY THE CONTRACTOR BEFORE EXECUTION.
6. ENGINEER IN CHARGE/ SITE ENGINEER SHOULD VERIFY THE RAIL LEVEL FORMATION LEVEL , BED LEVEL & TRACK CENTER AT SITE BEFORE COMMENCEMENT OF WORK.
7. ENGINEER IN CHARGE SHALL ENSURE THE SAFETY OF DFC TRACK AND STRUCTURE DURING EXECUTION OF WORK.
8. ENGINEER IN CHARGE SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT DAMAGE OF S&T CABLE/OFC DURING EXECUTION OF WORK. CONCERNED DEPT. SUCH AS BSNL/AIRTEL/SSE/ (Sig.)/ NR, DFCCI ETC. SHALL BE INFORMED WELL IN ADVANCE BEFORE EXECUTION OF WORK.
9. DURING CONSTRUCTION, IF REQUIRED, ROAD CLOSURE TO BE OBTAINED FROM CONCERNED ROAD/CIVIL AUTHORITIES. DIVERSION OF ROAD IF ANY, REQUIRED IS TO BE DONE BY CONTRACTOR AT HIS COST
10. THIS DRAWING IS THE PROPERTY OF HRIDC AND FOR EXCLUSIVE USE OF HORC.
11. DETAILED GAD WILL BE PREPARED BASED ON THIS CONCEPTUAL APPROVED GAD.

B) TECHNICAL NOTES :

1. STANDARD OF LOADING :- SUPER STRUCTURE-32.5T (RDSO STANDARD OWG),& SUB STRUCTURE-32.5T- LOADING,.
2. DESIGN CRITERIA SHALL BE BASED ON FOLLOWING IRS CODES
   a.IRS BRIDGE RULE
   b.IRS CONCRETE BRIDGE CODE
   c.IRS BRIDGE SUB-STRUCTURE & FOUNDATION CODE
   d.IS 2911 PART-1 SECTION-2.
3. SEISMIC ZONE- IV
4. EXPOSURE CONDITION-MODERATE.
5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE. GRADE OF CONCRETE :
   a. ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   b.LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 30M,BOTH SIDES ON APPROACHES OF BRIDGE SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015
8. INSPECTION STEPS SHALL BE PROVIDED AT DIAGONALLY OPPOSITE SIDES ON BOTH ENDS OF THE BRIDGE AFTER PROTECTION WORK.
9. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
10. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFIRMING TO IS: 3117.
11. 75mm DIA WEEP HOLES TO BE PROVIDED @1000 C/C HORIZONTAL AND 1000 MM C/C VERTICALLY IN RETURN WALL & ABUTMENT THROUGHOUT.
12. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB-STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
13. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT. IF REQUIRED GROUND IMPROVEMENT MAY BE CARRIED OUT AND CONFIRMED THROUGH FIELD TESTING.
14. THE STRUCTURAL DIMENSIONS AND SIZES ARE INDICATIVE AND THESE MAY VARY DURING DETAIL DESIGN.
15. SIZE, TYPE OF FOUNDATION & GROUND IMPROVEMENT DETAILS SHOWN ARE TENTATIVE AND MAY CHANGE DURING DETAILED DESIGN.
16. SEISMIC ARRESTOR SHALL BE PROVIDED ON THE PIER/ABUTMENT CAP.
17. DETAIL OF TOE WALL SHALL BE PROVIDED AS PER SKETCH NO. GC-HRIDC-SK-GEN-014_A1

C) OTHER NOTES :

1. FOR SUPERSTRUCTURE DETAIL FOLLOW RDSO DRG.NO'S : RDSO 10281,10281/1 AND 10281/2.
2. TRANSITION SYSTEM TO BE ADOPTED ON BRIDGE APPROACHES SHALL BE AS PER RDSO REPORT NO. GE:R-50(TRANSITION SYSTEM ON APPROACHES OF BRIDEGES). FOR DETAILS REFER SKETCH NO. GC-HRIDC-SK-GEN-019.
3. RCC LINING SHALL BE CONSTRUCTED FOR CANAL FROM ROW TO ROW OF HORC .
4. RCC LINING SHALL BE OF MIN 150 MM THICK AND HAVING AT LEAST MIN TEMP REINFORCEMENT.

5. FOR CONCRETE SPECIFICATION REFER IRS CONCRETE BRIDGE CODE.
   GRADE OF CONCRETE :
   a. ALL RCC /WEARING COURSE : M:35/DETAILED DESIGN DRG.
   b. LEVELING COURSE/PCC : M:20/DETAILED DESIGN DRG.
6. REINFORCEMENT SHALL BE Fe 500D (TMT) CONFORMING TO IS 1786.
7. PROTECTION WORK ON SLOPES OF BANK UP TO 30M, ON APPROACHES OF VIADUCT ABUTMENT A1 SHALL BE DONE AS PER SKETCH NO. GC-HRIDC-SK-GEN-015.
8. INSPECTION STEPS SHALL BE PROVIDED ON BOTH SIDES OF ABUTMENT A1 OF THE VIADUCT.
9. ALL CLEAN/ EXPANSION JOINTS SHALL BE FILLED WITH THERMOCOL. .
10. ALL RCC SURFACES COMING IN CONTACT WITH SOIL SHOULD BE PAINTED WITH BITUMEN OR COAL TAR OF APPROVED QUALITY @ 1.464 K.G/SQM. CONFORMING TO IS: 3117.
11. THE BACK FILL MATERIAL SHALL BE CONFORMING TO CLAUSE 7.5 OF IRS SUB-STRUCTURE AND FOUNDATION CODE. ANGLE OF INTERNAL FRICTION OF BACKFILL SHALL NOT BE LESS THAN 33 °.
12. BEARING CAPACITY OF SOIL SHALL BE ENSURED AS PER DETAILED DESIGN REQUIREMENT.
13. THE STRUCTURAL DIMENSIONS AND SIZES SHOWN ARE INDICATIVE AND THESE MAY VARY DURING DETAIL DESIGN.
14. SEISMIC ARRESTOR SHALL BE PROVIDED ON THE PIER/ABUTMENT CAP.
15. VIADUCT SHALL BE PROVIDED WITH LWR & BLT AS PER DETAILED DESIGN.
16. C-4 CONTRACTOR SHALL CONSTRUCT ABUTMENT A-2 OF VIADUCT AND HANDOVER THE SITE TO C-5 CONTRACTOR FOR CONSTRUCTION OF SUPERSTRUCTURE. C-5 CONTRACTOR SHALL PROVIDE THE DESIGN PARAMETERS FOR CONSTRUCTION OF ABUTMENT OF A-2 TO C-4 CONTRACTOR.
17. SPAN ARRANGEMENT BETWEEN P149 AND ABUTMENT A2 ARE NON-STANDARD AND WILL BE FINALISED AFTER FINALISATION OF EXISTING ROCK PROFILE AND AVAILABILITY OF SEATING WIDTH FOR ABUTMENT A2.

TITLE:- CONCEPTUAL PLAN
TYPICAL DETAILS OF PROTECTION WORK OF BRIDGE

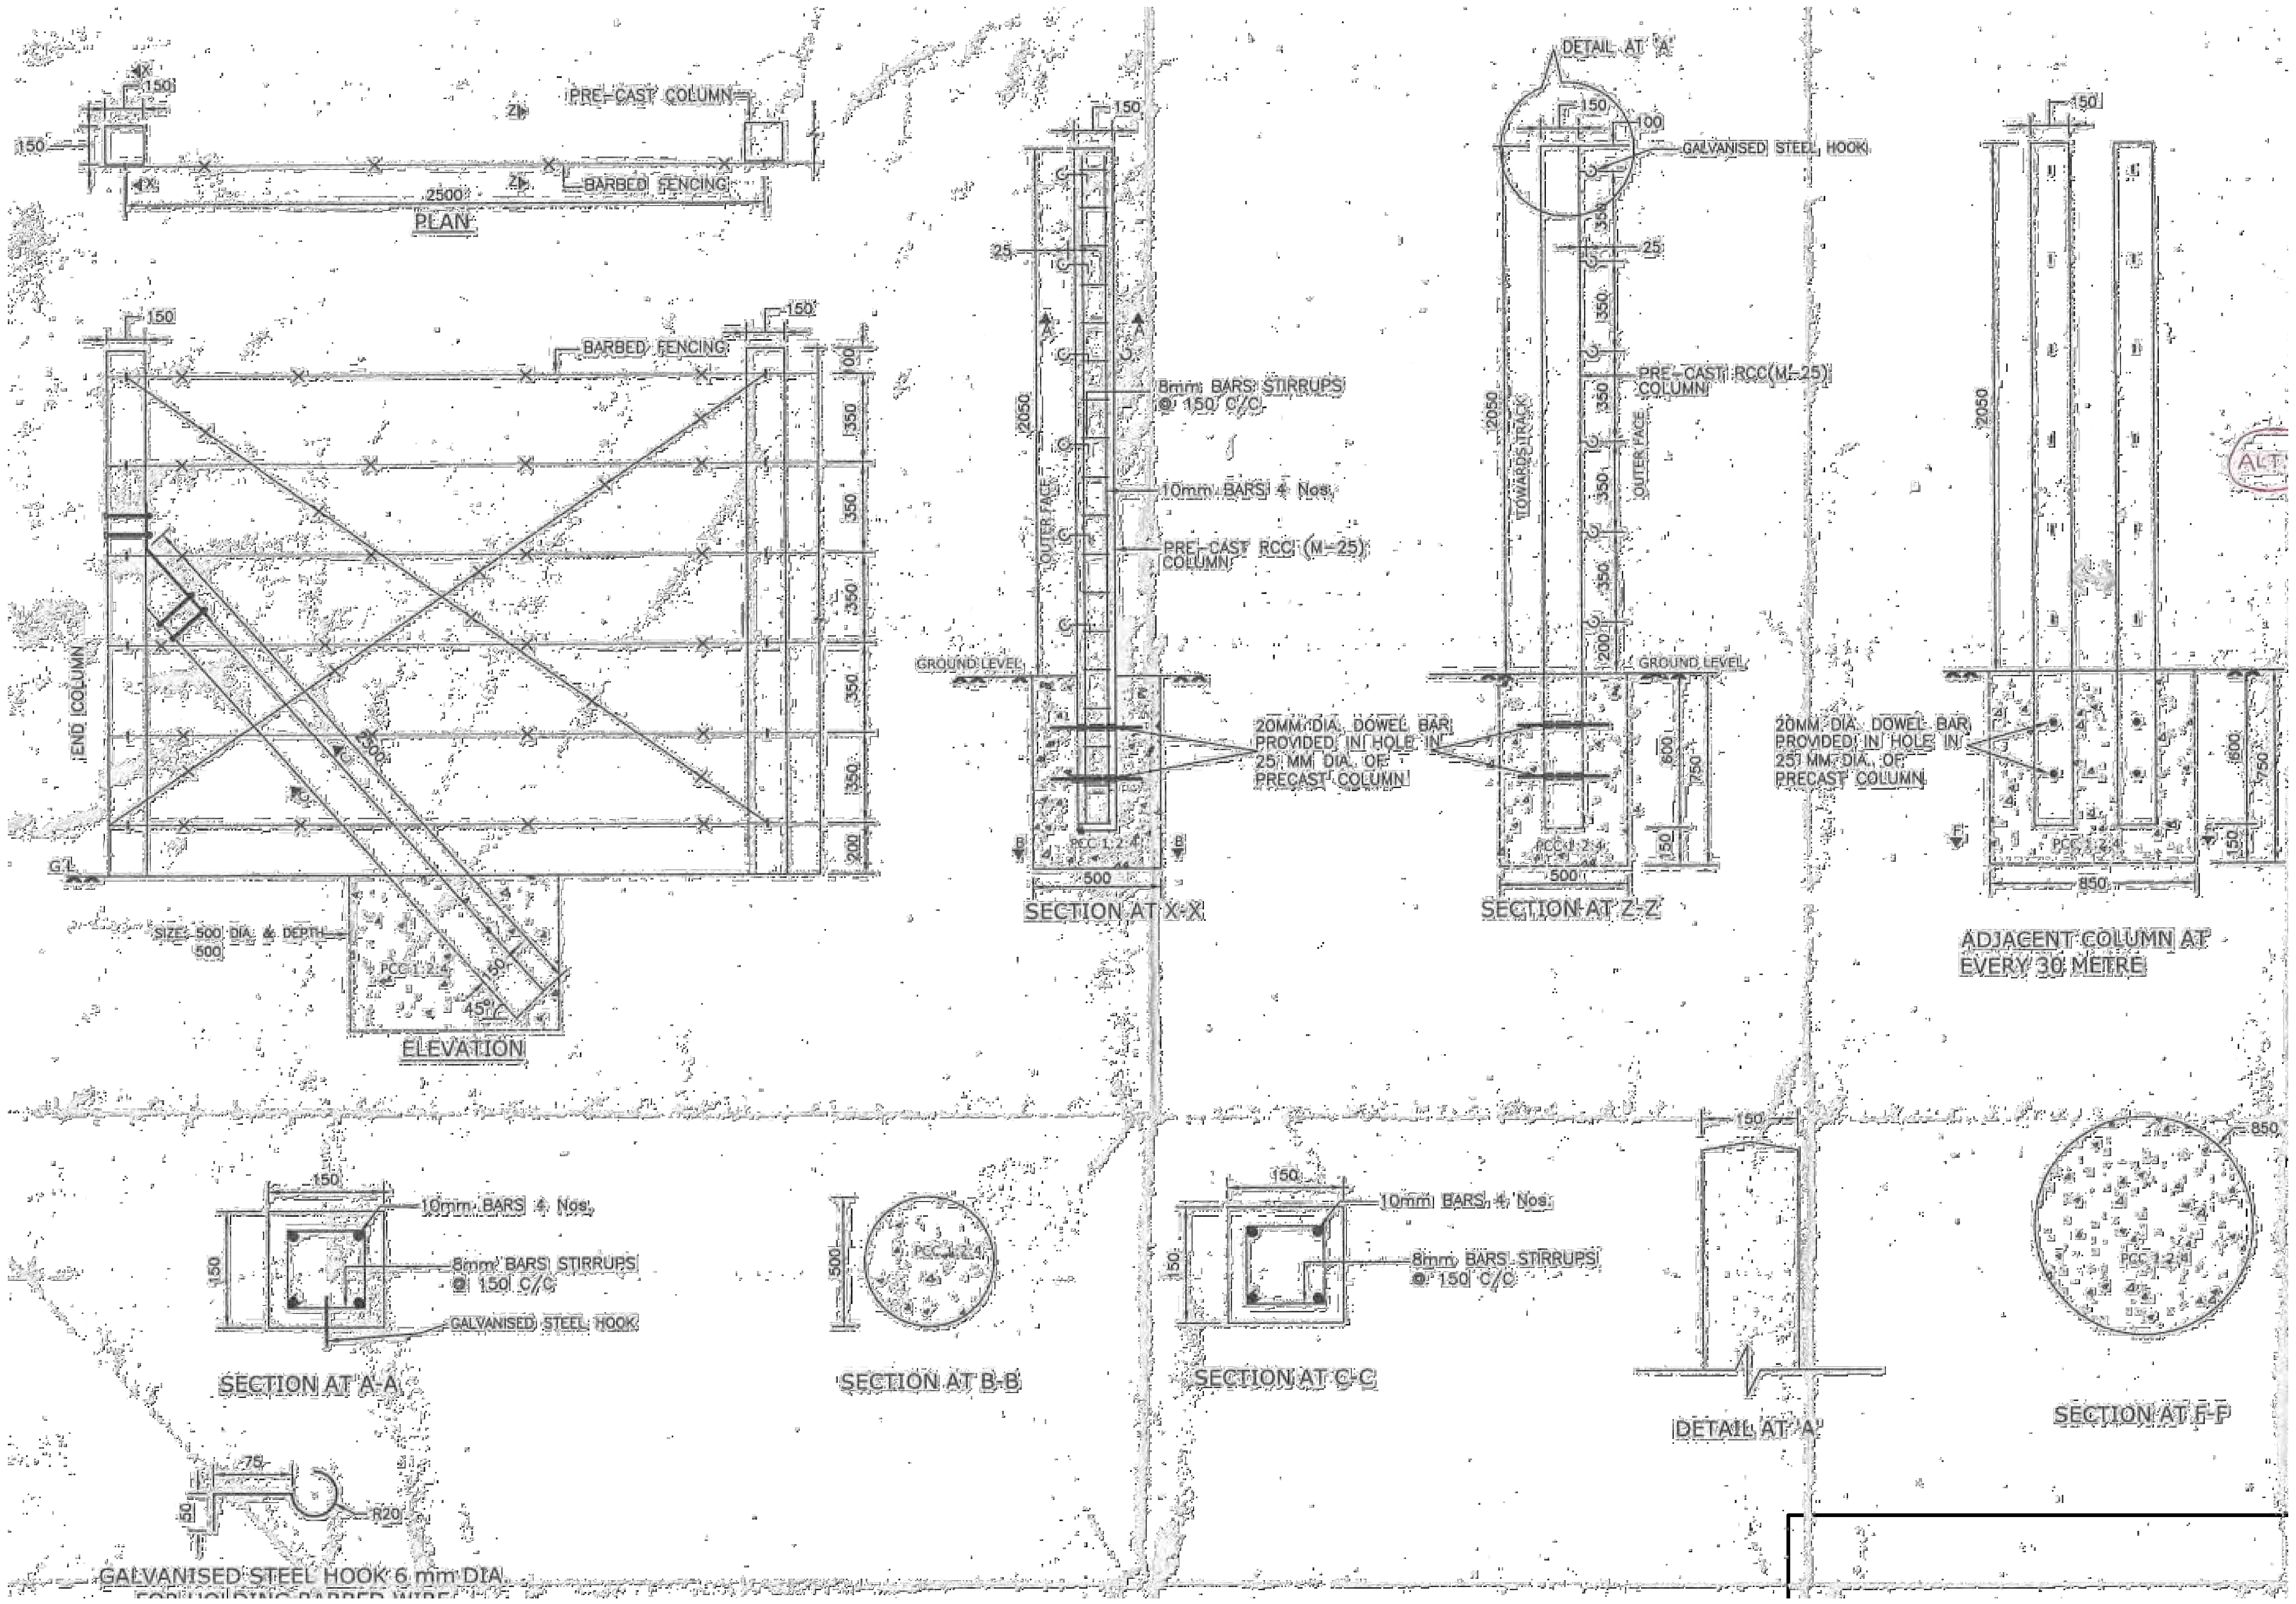
DRG. NO. GC-HRIDC-SK-GEN-015_A1

SHEET NO.

SCALE :	ISSUE DATE	REVISED DATE
AS SHOWN	10-10-2023	

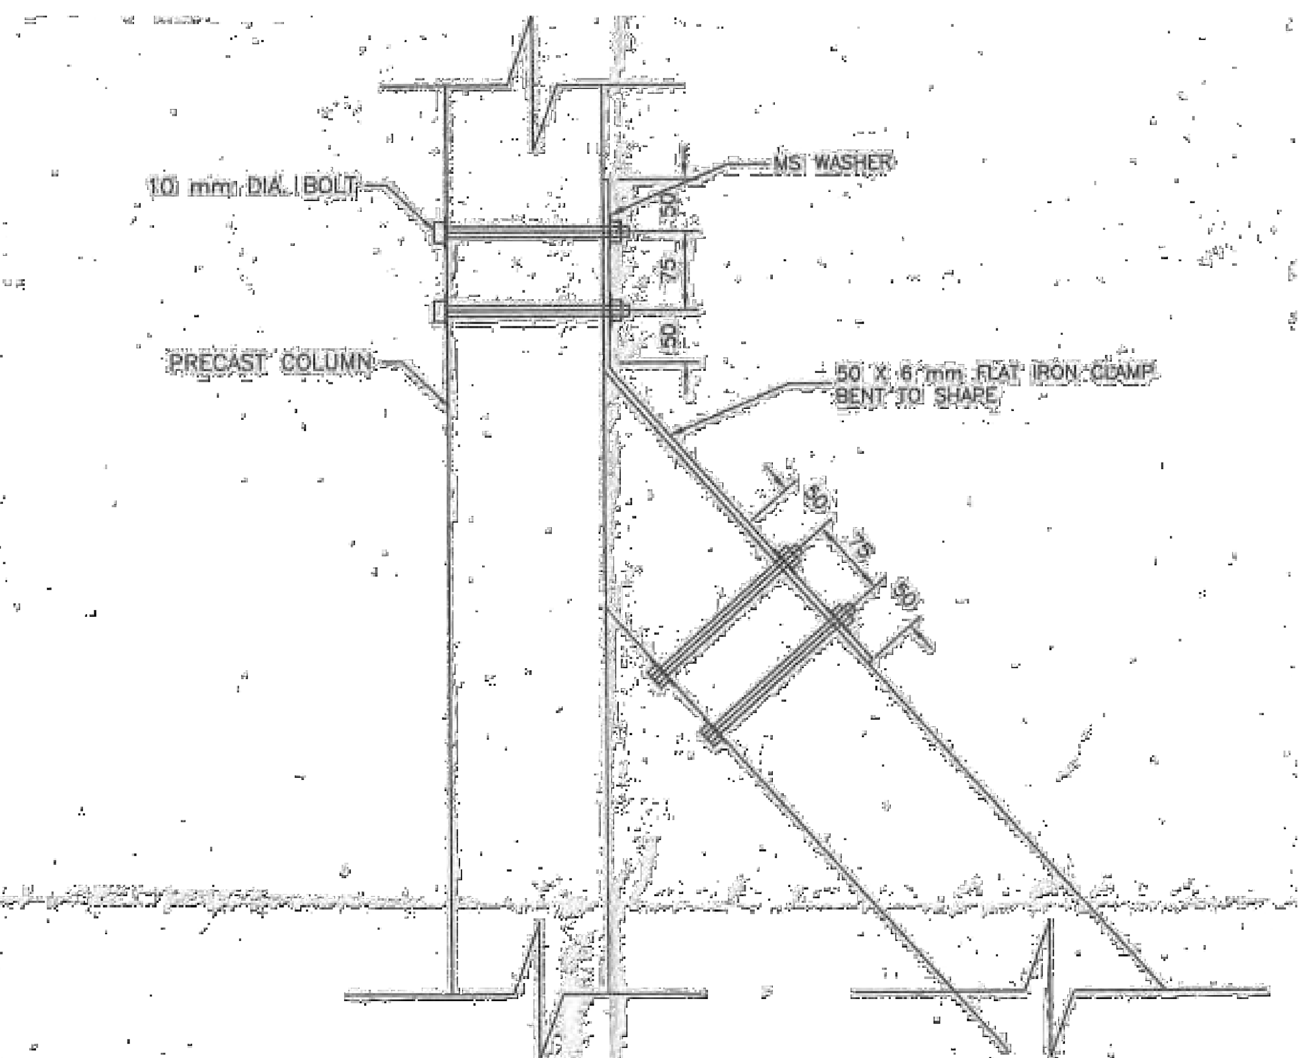
Notes:

1. THIS DRAWING IS BASED ON RDSO DRAWING NO. RDSO/WKS/2019/2.
2. GRADE OF CONCRETE M25.



NOTES:

1. ALL DIMENSIONS ARE IN mm UNLESS OTHERWISE SPECIFIED.
2. BARBED FENCING SHALL BE MADE OF G.I. BARBED WIRES CONFIRMING TO IS: 278. THE WEIGHT OF G.I. BARBED WIRE SHALL BE AS PER SOR.
3. THE G.I BARBED WIRES SHALL BE FIXED TO THE COLUMNS WITH HOOKS MADE OF 6 mm DIA. GALVANIZED STEEL. ANOTHER END OF GALVANIZED STEEL HOOK SHALL BE PLACED BEHIND STIRRUPS AND TIED WITH STIRRUPS AS PER DRAWING TO PROVIDE STRENGTH.
4. FOR ERECTION OF WIRE FENCING, RECOMMENDATIONS GIVEN IN IS:4996-1984 SHALL BE FOLLOWED. FENCING WIRE SHALL BE TIED TO GALVANISED STEEL HOOKS WITH SHORT PIECE OF LIGHT WIRE.
5. M-25 GRADE CONCRETE SHALL BE USED IN PRECAST COLUMN/ STRUT. COLUMN/ STRUT SHALL BE CAST AT CENTRALIZED DEPOT UNDER CONTROLLED CONDITION AS PER IS :456-2000.
6. TMT BARS OF GRADE FE 415/ 500 OF SPECIFIED DIA. SHALL BE USED. TMT BAR SHALL BE CONFIRMING TO IS: 1786 (LATEST).
7. ZONAL RAILWAY MAY PAINT THEIR INITIALS (SUCH AS NR, SER etc.) ON COLUMN AND STRUT.
8. STRUT OR BRACE SHALL BE FIXED WITH END RCC COLUMN BY SUITABLE ARRANGEMENT AS DETAILED IN DRAWING. 50 X 6 mm MS FLAT SHALL BE USED TO CONNECT STRUT/BRACE TO RCC COLUMN. 10 mm DIA. MS BOLT BLACK HEXAGONAL HEAD ROUND NECK WITH HEXAGONAL NUTS AND TWO WASHER SHALL BE USED. AFTER TIGHTING NUT, END OF BOLT SHALL BE HAMMERED TO MAKE ANTITHEFT.
9. SUPPORTING STRUT SHALL BE PROVIDED AT FIRST / END COLUMN OR CHANGE OF DIRECTION.
10. 1:20 SLOPE SHALL BE PROVIDED ON TOP OF COLUMN AT THE TIME OF CASTING.
11. AT EVERY 30 METRE TWO COLUMN SHALL BE GROUTED SIDE BY SIDE.
12. IN UNDULATING AREA, COLUMN SHALL BE PLACED ACCORDINGLY SO THAT BARBED WIRE ARE ALIGNED HORIZONTAL. VERTICALITY OF COLUMN SHALL BE CHECKED DURING ERECTION.
13. FOUNDATION SHALL BE DUG USING AUGAR/ MECHANICAL BORING EARTH SHALL BE RAMMED PROPERLY AND 50 MM SAND SHALL BE PLACED BEFORE FOUNDATION CASTING. FOUNDATION SHALL BE CURED PROPERLY.
14. THIS CATLE FENCE SHALL BE PROVIDED AT RAILWAY BOUNDARY.
15. IS:456(LATEST) SHALL BE FOLLOWED IN ALL R.C.C & P.C.C WORKS.



DETAIL OF JUNCTION OF PRECAST COLUMN AND STRUT

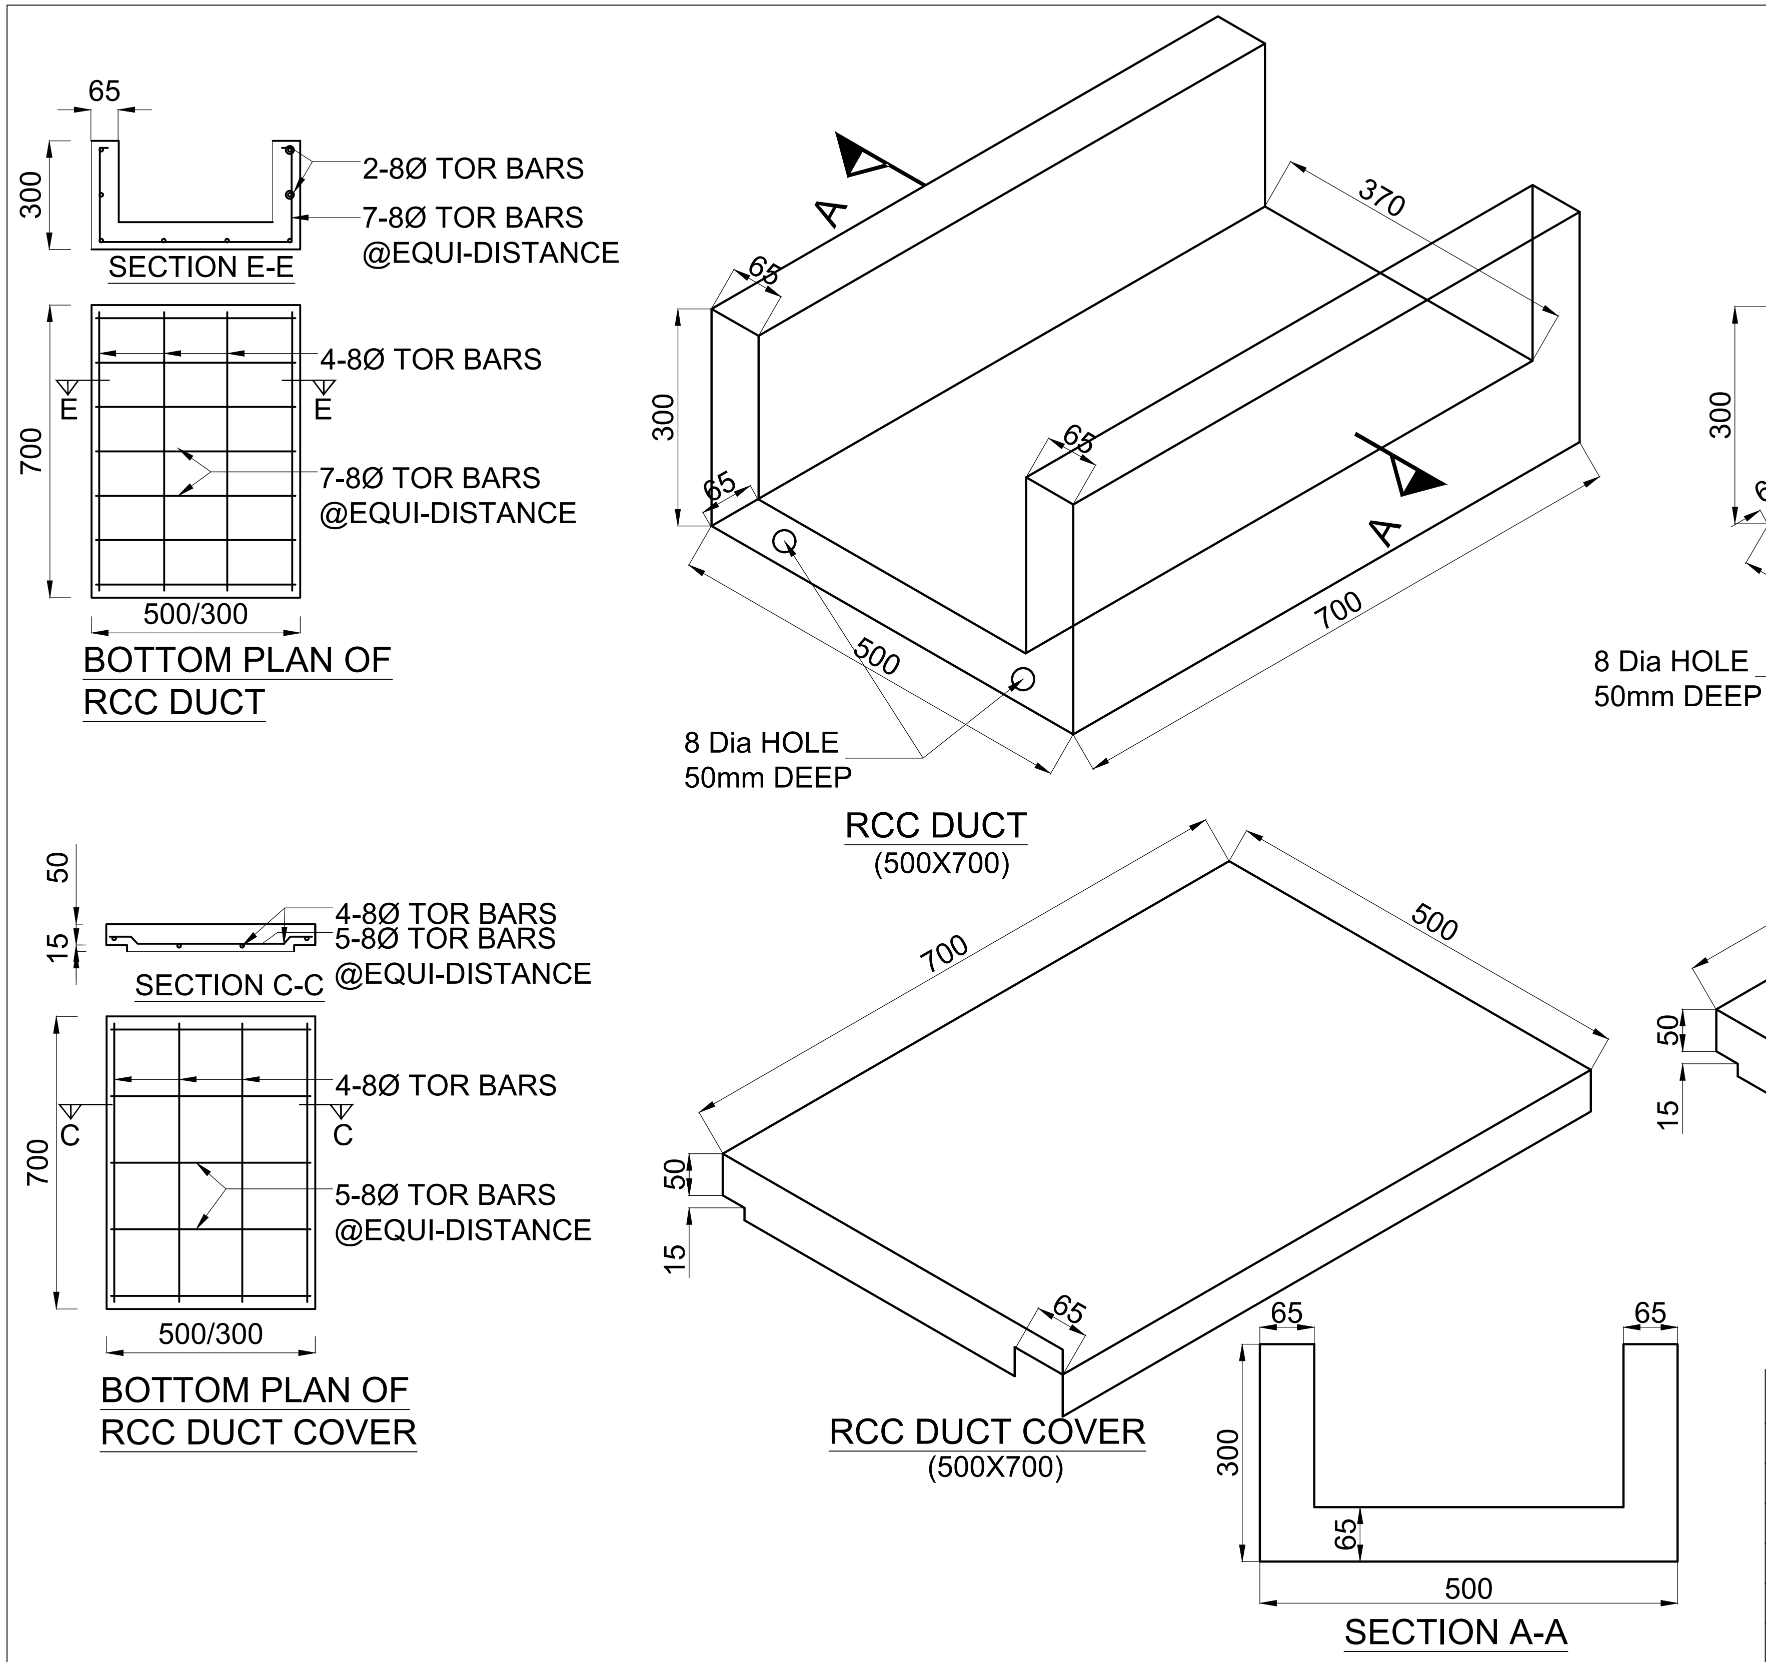
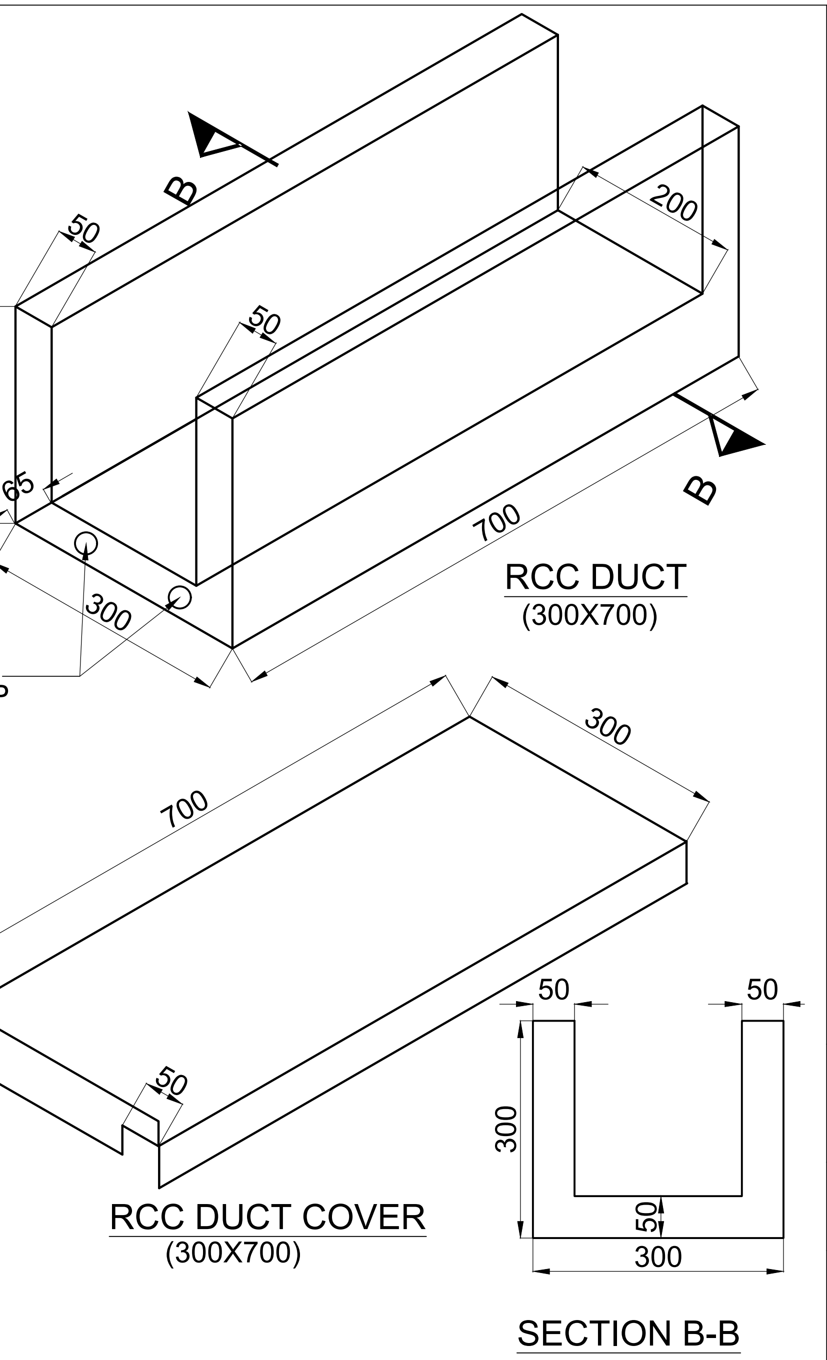
SCALE : AS SHOWN	ISSUE DATE 28.12.2022	





NOTES :

1. ALL DIMENSIONS ARE IN MILLIMETERS .
2. RCC DUCT SHALL BE LAID AT A DEPTH SUCH THAT THE TOP OF RCC COVER IS AT THE DEPTH OF MINIMUM 690mm BELOW GROUND LEVEL.
3. THE TRUNKING OF SEGMENT TO BE DONE BY PUTTING MS RODS OF 8 mm DIA x 100mm LONG (AS PER IS:432 PART(i)-1982 IN THE TWO HOLES PROVIDED.
4. DUCT SHOULD BE RCC PRECAST (FACTORY MADE) OF M-35 GRADE.
5. THIS DRAWING IS DEVELOPMENT FOR INCIDENTAL VEHICLE LOAD OF 10KN/M² OVER AND ABOVE EARTH PRESSURE.

SECTION FOR PLATFORM WALL

NOTES:
1. ALL DIMENSION ARE IN MILLIMETERS EXPECT LEVELS WHICH ARE IN METERS. NO DIMENSION SHALL BE SCALED FROM DRAWING ONLY WRITTEN DIMENSION ARE TO BE FOLLOWED.
2. 25MM CLEAR COVER SHALL BE PROVIDED TO ALL TYPES OF OUTERMOST REINFORCEMENT.
3. #INDICATES HIGH YIELD STRENGTH STEEL Fe-500 D(TMT) CONFORMING TO I.S. 2008.
4. ANCHORAGE SHALL BE 50 X DIA OF BARS & NOT MORE THAN 50% BARS SHALL BE LAPPED AT ONE SECTION. THE DISTANCE BETWEEN TWO LAPS SHALL BE MORE THAN 1.5 TIMES THE LAP LENGTH.
5. 50mm DIA. PVC PIPE AS WEEP HOLES ARE TO BE PROVIDED IN PLATFORM/TOE WALL @1000mm C/C HORIZONTALLY AND VERTICALLY STAGGERED. MINIMUM 50mm DISTANCE BETWEEN PIPE FACE & ALL STEEL MUST BE MAINTAINED.
6. THE BACK FILL IS TO BE PROVIDED CONFORMING TO CLAUSE 7.5 OF IRS SUB-STRUCTURE CODE. COMPACTION OF BACKFILL SHALL BE DONE AFTER COMPACTING THE SOIL GIVING PASSIVE PRESSURE FROM TRACK SIDE.
7. CONCRETE GRADE OF PLATFORM WALL SHALL BE M:35.
8. IT SHALL BE DESIGNED FOR SEISMIC ZONE IV.
9. COPING SLAB IS NOT MONOLITHICALLY CAST WITH WALL. IT SHALL BE PRESENT ON PLATFORM WALL TOP USING 1:3 CEMENT-SAND MORTAR COPING SHALL BE KEPT AFTER THE COMPACTION OF BACKFILL.
10. SIZE & REINFORCEMENT SHOWN IN DRAWING IS TENTATIVE AND DETAILED DESIGN SHALL TAKE CARE OF THE REQUIREMENT OF SEISMIC ZONE IV.
11. 25MM EXPANSION GAP SHALL BE PROVIDED AFTER EVERY 25m LENGTH.

Type Plan No. O-104/2021

Sub: Standard Type Plan of "Powder Toilet for Divyangjans"

In spite of the enabling policies and guidelines at national and state level regarding divyang toilet, there have been challenges faced by implementers and service providers because of lack of skills to deal with Divyang toilet due to in-adequate information.

In order to satiate the desire of Divyang Toilet, a Type Plan No. P-45/2019 (NRHQE Plan No. HQ/05/07-2019) of "Toilet & Ramp for Divyangs" has been already circulated earlier. In that, toilet enclosed both Water Closet & bathing facilities. A new Type Plan of "Powder Toilet for Divyangs" has been prepared, wherever, space is constrained. It encloses Water Closet with wash basin only. The layout plan conforms "Harmonised Guidelines and Space Standards for Barrier Free Built Environment for Person with Disability and Elderly Person (2016)" issued by MoUD, Govt. of India.

This Type Plan No. O-104/2021 (NRHQE No. HQ/20/11-2021) regarding **"Powder Toilet for Divyangs"** has been uploaded on Northern Railway website https://nr.indianrailways.gov.in/ and can be downloaded. This may be circulated to all concerned for implementation of instructions contained therein.

If any discrepancy found in above Type Plan, kindly inform this office. You may also send your comments/remarks/suggestions, if any to this office so that necessary improvements/ corrections may be incorporated.

Encl. - as above

TYPE PLAN NO.	: O-104/2021
CANCEL TYPE PLAN NO. :	......

NOTE:-

1. DO NOT SCALE THIS DRAWING.
2. THIS DRAWING IS TO BE READ WITH ALL RELATED INFORMATION.
3. ALL DIMENSIONS TO BE VERIFIED ON SITE BY MAIN CONTRACTOR BEFORE THE COMMENCEMENT OF ANY DRAWING OR WORK WHATSOEVER.
4. ALL DIMENSIONS ARE IN MILLIMETER UNLESS SHOWN OTHERWISE.
5. ALL GRAB RAIL SHOULD BE PROPERLY FIXED TO HANDLE THE MINIMUM LOAD OF 45 kg (100 lbs).
6. ANTI-SKID OR SLIP RESISTANT TILES SHOULD BE USED ON FLOORING.
7. MIRROR SHOULD BE TILTED AT AN ANGLE OF 30° FOR BETTER VISIBILITY OF WHEELCHAIR USER.
8. VENTILATOR (600mm x 600mm) TO BE PROVIDED ACCORDING TO SITE OPENING.
9. ACCESSIBLE TOILET SHOULD HAVE THE INTERNATIONAL SYMBOL OF ACCESSIBILITY (WITH BRAILLE SIGNAGE) DISPLAYED OUTSIDE FOR WHEELCHAIR ACCESS (Figure 1).
10. THERE SHOULD BE ADEQUATE COLOUR & TONAL CONTRAST BETWEEN THE FIXTURES, WALLS & FLOORING. THIS IS TO ENABLE EASY RECOGNITION BY PERSONS WITH VISUAL IMPAIRMENTS.
11. TOILET LEVEL SHOULD BE KEPT SAME AS LEVEL OF PLATFORM SO AS TO AVOID REQUIREMENT OF RAMP.
12. THIS DRAWING IS BASED ON RAILWAY BOARD'S LETTER NO. 2019/Stn.Dev.-I/03/06/Policy/PwDs dated 12.02.2020.

3. List of Charted Utilities

3. List of Charted Utilities

Ref. Sub-Clause 10.45 & 10.46, Appendix 10, Section VII-9: Appendices, Part 2- Employer's Requirements

3.1.1 Overground Electrical Crossings

a) Overhead Electrical Crossings: LT and HT (up to 33 KV)

S. No.	Type of crossings	Chainage No.
1	11kV HT Parallel	(-) 0+880 to (-)1+470
2	11kV HT Crossing	(-880)
3	11kV HT Crossing	(-1470)
4	11kV HT Crossing	(-) 1+390
5	11kV HT Parallel	(-) 1+055 to (-) 1+390
6	11kV HT Parallel	(-724 to -319)
7	11kV HT Crossing	(-724)
8	11kV HT Crossing	(-319)
9	11kV HT Crossing	0+429
10	11kV HT Crossing	0+860
11	11kV HT Crossing	1+642
12	11kV HT Parallel	1+600 to 1696
13	11kV HT Crossing	1+651
14	11kV HT Crossing	2+863
15	11kV HT Crossing	3+106
16	11kV HT Crossing	3+513
17	11kV HT Crossing	4+123
18	11kV HT Crossing	4+294
19	11kV HT Crossing	4+805
20	11kV HT Crossing	4+826
21	11kV HT Crossing	5+805
22	11kV HT Crossing	6+954
23	11kV HT Parallel	7+289 to 7+300
24	11kV HT Crossing	7+289
25	11kV HT Parallel	7+289+100
26	11kV HT Crossing	7+657
27	11kV HT Crossing	7+807
28	11kV HT Crossing	9+226
29	11kV HT Crossing	11+879
30	11kV HT Parallel	11+879 TO 12+070
31	11kV HT Crossing	12+070
32	11kV HT Crossing	20+045
33	33 kV HT Parallel	20+058 to 21+880
34	11kV HT Crossing	20+206
35	11kV HT Crossing	21+668
36	33 kV HT Crossing	20+400
37	33 kV HT Crossing	20+400

S. No.	Type of crossings	Chainage No.
38	33 kV HT Crossing	20+403
39	33 kV HT Crossing	20+403
40	33 kV HT Crossing	20+407
41	33 kV HT Crossing	20+407
42	33 kV HT Crossing	20+260
43	33 kV HT Crossing	20+104
44	33 kV HT Crossing	20+260
45	33 kV HT Crossing	20+261
46	11kV HT Crossing	23+041
47	11 kV HT Parallel	23+536
48	11 kV HT Parallel	23+746

b) EHT (above 33 KV)

S. No.	Type of crossings (Voltage Level)	Owner	Feeder name	Chainage (m)	Remarks
1	EHT Crossing (220 kV)	HVPNL	BTPS - Alwar Line	00+815	Not Required to be modified
2	EHT Crossing (400 kV)	GPTL	Prithla - Kaderpur Line	03+070	Not Required to be modified
3	EHT Crossing (400 kV)	PGCIL	Ballabhgarh - Agra Line	05+676	Not Required to be modified
4	EHT Crossing (220 kV)	HVPNL	Sec-72- Rangala Rajpur LILO Line (IMT Sohna)	19+950	Modification work is in progress
5	EHT crossing (66 kV)	HVPNL	Sohna-Nuh Nagina Line	20+500	Modification work Completed

4. Indicative List of Existing Structures to be Dismantled /to be filled (Tube Wells, Bore Wells and Wells)

4. Indicative List of Existing Structures to be Dismantled /*to be filled (Tube Wells, Bore Wells and Wells*

(Ref. Sub-Clause 10.14, Appendix 10, Section VII-9: Appendices, Part 2 – Employer's Requirements)

Structures in Main Line							
S. No.	**Type of Structure**	**Chainage (in m)**	**District**	**Sub Division**	**Length of Obstruction to be considered (in m)**	**Chainage**

5. Approved Manufactures/Suppliers List

5. Approved Manufactures/Suppliers List

All materials and products shall conform to the Outline Construction Specification (OCS), BIS codes and other relevant codes etc. and shall be of make as approved by the Engineer.

The list of approved makes for products and materials is given below. Other equivalent manufacturers may also be considered with prior approval of the Engineer, if found conforming to all standards. Such requests should be made with all documents to the Engineer at least 45 days before the material is required and any order shall be placed only after receiving the written approval of the Engineer.

S. No.	Details of Materials/ Products	Manufacturer's Name
1.	Cement	ACC, Ultratech, Ambuja Cements, JK Lakshmi, JSW, JK Cement, Lafarge, Shree Cement, Birla Cement, Grasim
2.	Reinforcement Bars	SAIL, JSW STEEL, TATASTEEL, RINL, JSPL
3.	Epoxy	FOSROC, SIKA QUALCRETE, BASF, CICO, MC–BAUCHEMIE, MAPEI, CHRYSO, Huntsman Advanced Materials
4.	Expansion Joints for Viaduct	Prequalified Manufacturers as per RDSO's latest approved list
5.	Admixtures	FOSROC, SIKA, MC-BAUCHEMIE, CHRYSO, MAPEI, CICO
6.	Pile Integrity Testing	CIMEC, Geodynamics, AIMIL, CBRI, Pile Dynamic, CEGTH, FUGRO
7.	*Anchor Fastener	HILTI, FISHER, BOSCH, (Please note that ETA Certification is mandatory for using/supplying fasteners for load bearing structural members)
8.	Structural Steel	TATA, SAIL, ESSAR, JSPL, JSW
9.	Pre- stressing Strand (LRPC)	TATA SSL Ltd, USHA MARTIN
10.	*Pot/Elastomeric /Spherical Bearings	Prequalified Manufactures as per RDSO's latest approved list.
11.	HDPE Sheathing	Rex Polyextrusion, Gwalior Poly Pipes Ltd, Dynamic Prestress, JK Prestressing

6. DFC Letter – Approval of GAD of HORC alignment crossing under DFC bridge 87

डेडीकेटेड फ्रेट कॉरीडोर कार्पोरेशन ऑफ इंडिया लि.
भारत सरकार (रेल मंत्रालय) का उपक्रम
Dedicated Freight Corridor Corporation of India Ltd.
A Govt. of India (Ministry of Railways) Enterprise

डेडीकेटेड फ्रेट कॉरीडोर

No: DFCC/Noida Unit/DMIC/HRIDC/ 8228 Dated: 03-06-2023

Chief Project Manager/HRIDC
Plot No. 143, 5th Floor, Rail Tel Tower
Sec-44, Gurugram, Haryana-122003

Sub: - Approval of GAD of HORC alignment crossing under DFC bridge 87.

Ref: -

i. Your Letter No. HRIDC/GGN/DFCCIL/2021/1637 dated 10-02-2022.
ii. This office letter no. DFCC/Noida Unit/DMIC/HRIDC/7726 dated 04.03.2023.
iii. Presentation made by HRIDC before director Infra at prithala on 09.05.2023.
iv. your office letter no. HRIDC/GGN/DFCCIL/2021/1914 dated 19.05.2023.

Under the above reference in principal approval for crossing HORC alignment under DFC bridge no. 87 is granted subject to fulfilment of following conditions.

(i) HORC track will be placed clear-off DFC Bridge structure as per SSOD of DFCC/HORC.
(ii) Drawings of DFC Bridge no. 87 are attached herewith for further planning at the end of HRIDC.
(iii) The HORC structural components (viz. Sub-structure, super-structure and foundations) shall be planned/executed at-least 2.0 m clear distance (in plan) from DFC Bridge structural components (viz. sub-structure and foundation).
(iv) HORC Bridge pile/open foundations will be designed duly accounting base pressure below DFC bridge open foundations.
(v) HORC UP-line Bridge foundation is shown adjacent to DFC Bridge foundation. This indicates that there will be overlap of pressure bulb of adjacent foundations. It will be ensured that sufficient bearing capacity is available against the super-imposed base pressure of DFC bridge foundation and HORC bridge foundation.
(vi) Since it is proposed to carry out tunnelling works from Sonipat end, rock/boulders may hit DFC Bridge components while opening of tunnel on DFC Bridge side. HRIDC will submit and obtain DFCCIL approval for the protection arrangement/scheme for DFC works prior to opening of tunnel.
(vii) HRIDC will submit the detailed safety plans for the approval of DFCCIL before start of any execution work near to DFCCIL track.
(viii) HRIDC will submit, analysis of safety, stability and protection measures (temporary and permanent) duly proof checked by IIT/NIT for the DFCC works.
(ix) Sub-structure and foundation of HORC will not infringe with the toe of the buttress wall.
(x) Adequate protection (temporary/permanent) arrangements will be made for DFC Bridge structure, embankment and rock surface during construction of HORC bridge structure and tunnel works.
(xi) Existing drainage works will be re-instated to their original condition. In case, HORC drainage plan is affecting existing drainage scheme, drainage works shall be designed and executed by HRIDC duly accounting DFC drainage requirement, with prior approval of DFCCIL at the cost of HRIDC.
(xii) Duly proof checked (from IIT/NIT) detailed GAD, Design/Drawings of pier/abutment, super-structure and rock slope stability shall be submitted to DFCCIL for his review and approval start of any execution work the vicinity of DFCCIL ROW.
(xiii) HRIDC will be required to submit the construction programmer before the actual start of the work.

03/6/23

(xiv) Whenever necessary/required, HRIDC will seek permission for issuance of **Traffic Work Order** (TOW) from DFCCIL for the activities which may affect train operations and safety of the DFC works.

(xv) HRIDC or its Contractor will interface with DFCCIL Contractor for the planning and execution of HORCL works in DFC ROW.

(xvi) DFCCIL reserves the right of cancellation of approval on violation of any of the condition and may impose any other condition to ensure the safety of DFC bridge structure and DFC train operation.

(xvii)HRIDC will indemnify DFCCIL regarding any damage during construction of HORC line and any damage to DFC works shall be reinstated to its original condition by the HRIDC at his own cost..

HRIDC will indemnify, defend and hold DFCCIL harmless against any and all proceedings, action and third-party claims for any loss, damage, cost and expenses arising out of any action of HRIDC or its Contractor under this work.

LIST OF TABLES

ANNEXURES

EXECUTIVE SUMMARY

General Objectives of Investigation: The scope of work was to complete **"Exploring alternate alignments, final location survey, geological mapping, geo-technical investigation, detail design of tunnel & its approaches including Viaduct if any and other ancillary work in Sohna-Manesar Section of HORC project."** This report presents the results of the Site Investigation and Geotechnical recommendations related to the Project.

Fieldwork and Laboratory Testing: Twelve nos. of borehole at location **Abutment(BH NO -2), Pier(BH NO-3, BH NO-4,BH NO-5,BH NO-6,BH NO-7,BH NO-8,BH NO-9,BH-10,BH-11,BH-11A,BH NO-12)** were drilled. Field-testing of subsoil was conducted and soil samples at various depths were collected during drilling. Geotechnical laboratory tests on collected soil samples were conducted at our laboratory (NABL accredited) at New Delhi. These tests include Grain Size Distributions, Hydrometer Analysis, Atterberg's Limits, Density, Moisture Content, Specific Gravity, Shear Strength Parameters, Void Ratio and Consolidation Test and of soil samples.

Report on Foundation System: A general description of the strata encountered during boring, the soil properties, details of field Test, Laboratory Test and groundwater levels are provided in this report. Recommendations for Foundations based on Geotechnical Engineering parameters related to the proposed structure **(Viaduct)** have been given in this report. The design of Pile Foundations is based on parameters derived from Geotechnical Investigations. The calculation of safe load carrying capacity of pile foundation was carried out as per the relevant clauses of IRC 78 and IS Codes.

1.0.INTRODUCTION

This report presents results of sub-soil Exploration work for **"Exploring alternate alignments, final location survey, geological mapping, geo-technical investigation, detail design of tunnel & its approaches including Viaduct if any and other ancillary work in Sohna-Manesar Section of HORC project." Abutment(BH NO -2), Pier(BH NO-3, BH NO-4,BH NO-5,BH NO-6,BH NO-7,BH NO-8,BH NO-9,BH-10,BH-11,BH-11A,BH NO-12).** This work was performed by **M/s. S. M. Consultants, Bhubaneswar** under **Haryana Rail Infrastructure Development Corporation Ltd.**

2.0.PURPOSE AND SCOPE OF SERVICES

The purpose of the current geotechnical investigation was to explore and determine the existing sub-strata conditions such as stratification, denseness or hardness of the strata, position of ground water table etc. at the location and to evaluate shear strength parameters for determination of safe bearing capacity and foundation system of proposed structure (**Viaduct**) using procedures as provided in the relevant IS codes. The goal of our investigation was to identify the key geotechnical issues that could potentially affect the proposed project and to develop geotechnical recommendations for design and construction of foundation of related structures.

Our scope of services included the following tasks:

- Field marking of boring locations.
- Drilling of **twelve** numbers of boreholes up to the required depth below the existing ground level in order to know the sub surface stratification, conducting necessary field tests and collection of sub-strata samples for laboratory testing.
- Testing of soil samples in the laboratory to determine its physical and engineering properties and analyzing all field and laboratory data to evaluate bearing capacity of the sub-strata for given foundation sizes.
- Preparation of this report containing our findings and recommendations including:
  a) Brief description of the proposed project;
  b) Description of the field exploration and laboratory testing programs;
  c) Discussion on the site surface and subsurface conditions.
  d) Preliminary geotechnical parameters for design of foundations for structural support.

3.0. PROJECT DESCRIPTION

Proposed site is located at Sohna, Haryana.

3.1. Location And Topography of Haryana

3.1.1. Geography

Haryana is in north India and has a total area of 44212 square kilometres. Haryana surrounds the country's capital Delhi on three sides (north, west and south). Haryana is a landlocked state in northern India. It is between 27°39' to 30°35' N latitude and between 74°28' and 77°36' E longitude. The total geographical area of the state is 4.42 m ha, which is 1.4% of the geographical area of the country. The altitude of Haryana varies between 700 and 3600 ft (200 metres to 1200 metres) above sea level.

3.1.2. Climate

Haryana is extremely hot in summer at around 45 °C (113 °F) and mild in winter. The hottest months are May and June and the coldest December and January.[83] The climate is arid to semi-arid with average rainfall of 354.5 mm. Around 29% of rainfall is received during the months from July to September, and the remaining rainfall is received during the period from December to February.

3.1.3. Rainfall

Haryana gets highest rainfall (33%) of south west monsoon rainfall in August month while the July month get 32% of the south west monsoon rainfall. June and September receive 14% and 21% of south west 5 monsoon rainfall. Also more than 82% of annual rainfall receives during the southwest monsoon season only. The variability of monsoon or annual rainfall is 31% and 27% respectively.

3.1.4. Seismic zone

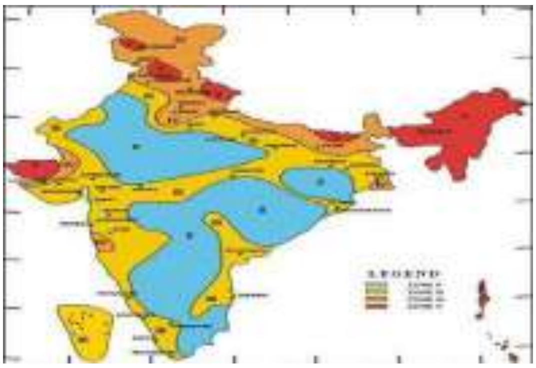

Figure 1. Seismic zone of India

Haryana falls under seismic zones IV. zone IV is considered a high-damage risk zone.

4.0. FIELD INVESTIGATION PROGRAM

Field investigation work was in accordance with IS 1892 -1979.

Field works include:

- Boring in the sub-strata by Rotary Boring Method.
- Collection of disturbed & undisturbed samples from bore holes.
- Conducting SPT in soil as per IS: 2131-1981(Reaffirmed 2016) and collection of SPT samples.

4.1. Present Site Location:

Present site is located at Sohna . Boreholes were conducted for a proposed structure i.e. **(Viaduct).**

4.2. Methodology of Investigation:

By using Rotary Boring, the borehole was progressed up to desired depth. Rotary Boring method of boring is most widely used method of advancing a boreholes. This method along with use of drilling mud to stabilize the side of the borehole is likely to give the least disturbance to soils beneath the base of the borehole and permit taking near to truly undisturbed samples. Diameter of boreholes was 150mm. Where caving of boreholes occurred, casings were used to keep the boreholes stable.

Standard Penetration Tests (SPT) was conducted in the boreholes alternate to UDS. By connecting a split spoon sampler to ‘A’ rods and driving it by 45cm using a 63.5 kg hammer falling freely from a height of 75cm. The tests were conducted in accordance with IS: 2131-1981(Reaffirmed 2016).

Number of blows required for each 15cm penetration of the split spoon sampler was recorded. First 15cm penetration is ignored. The cumulative no. of blows required to penetrate the rest 30cm of the 45cm sampling interval is reported as the SPT value (N value).

Bore logs showing field data of each borehole has been attached in this report **(ANNEXURE-A).**

4.3. Logging and Sample collection:

During exploration for each borehole log of borings showing details about the exploration were prepared. Bore logs were presented in this report under **Annexure-A.**

Disturbed samples were collected from the split spoon sampler after conducting SPT. The samples were preserved in transparent polythene bags with proper identification mark.

In case of undisturbed samples, tubes were sealed with wax at both the ends. Then samplers were wrapped with moist jute bags to prevent loss of moisture.

4.4. Summary of fieldwork:

The table below shows the numbers of boreholes with max-explored depth and depth of water table encountered.

Table - 1

BH Reference	Chainage Reference in m	Ground Level RL in m.	Max depth of exploration in m.	Ground water table below E.G.L in m.
A-(BH NO-02)	21305	191.135	32.0	1.5
PIER- (BH NO-03)	21805	191.220	32.0	2.5
PIER- (BH NO-04)	22265	191.013	32.0	2.0
PIER- (BH NO-05)	22160	192.226	32.0	3.0
PIER- (BH NO-06)	22660	194.594	32.0	Not Found
PIER- (BH NO-07)	23160	196.146	32.0	Not Found
PIER- (BH NO-08)	23660	200.069	20.0	Not Found
PIER- (BH NO-09)	22705	191.897	40.0	1.90
PIER- (BH NO-10)	23205	193.009	40.0	2.40
PIER- (BH NO-11)	23705	193.717	40.0	1.80
PIER- (BH NO-11A)	24205	196.637	40.0	6.50
PIER- (BH NO-12)	24700	203.485	20.0	Not Found

Note: - This Report is for Alternative Alignment 2A.For BH No. 05, 06, 07 & 08 chainages are as per the old alignment-2.

5.0. LABORATORY TESTING

Laboratory methods in accordance with relevant standard codes of practices are adopted to ascertain the different essential characteristics of sub-soil using field samples obtained in during field investigations. The tests as under have been conducted to ascertain the parameters indicated in the test. The finding of these test are required for use in relevant engineering designs.

The table below shows the laboratory tests with concerned IS codes followed.

Table – 2

Sl. No.	Laboratory tests	IS Codes
1	Preparation of soil sample	IS: 2720(part-1)-1983 (Reaffirmed 2015)
2	Moisture Content	IS: 2720(part-2)-1973 (Reaffirmed 2015)
3	Specific Gravity	IS: 2720(part-3)(sec-1)-1980 (Reaffirmed 2016)
4	Grain Size Analysis	IS: 2720(part-4)-1985 (Reaffirmed 2015)
5	Atterberg's Limits	IS: 2720(part-5)-1985 (Reaffirmed 2015)
6	Bulk Density	----
7	Triaxial Shear Strength	IS: 2720(part-11)-1993 (Reaffirmed 2016)
8	Direct Shear Strength	IS: 2720(part-13)-1986 (Reaffirmed 2016)
9	Consolidation Test	IS: 2720(part-15)-1986 (Reaffirmed 2016)

The result sheets of the tests are presented in the subsequent pages.

6.0. DISCUSSION ON THE ENGINEERING PROPERTIES OF THE SUB-STRATA AT THE PROJECT SITE

Abutment (BH NO- 02, CH-21305 m)

1. From N.G.L to 1.5 m depth, a non-plastic, non-expansive Silty sand stratum exists from which one DS was collected at 0.5 m depth.
2. From 1.50 m to 32.0 m (max. explored) depth, medium-plastic, stiff to hard consistency silt & clay with low compressibility stratum exist from which six UDS samples were collected at 3.0 m,6.0 m,12.0 m,18.0 m,24.0 m & 30.0 m depth. The field SPT N values were found to be 11,15,22,28,48,54 & 66 at 1.50 m,4.5 m,9.0 m,15.0 m,21.0 m,27.0 m & 32.0 m depth respectively.

Pier - (BH NO- 03, CH-21805 m)

1. From N.G.L to 1.5 m depth, a non-plastic, Silty sand stratum exists from which one DS was collected at 0.5 m depth.
2. From 1.50 m to 9.0 m depth, medium-plastic, stiff to very stiff consistency silt & clay with low compressibility stratum exist from which two UDS sample were collected at 3.0 m & 6.0 m depth. The field SPT N values were found to be 12 & 17 at 1.50 m & 4.5 m depth respectively.
3. From 9.0 m to 12.0 m depth, a non-plastic, medium compacted Silty sand stratum exists. The field SPT N value was found to be 24 at 9.0 m depth respectively.
4. From 12.0 m to 21.0 m depth, medium-plastic, hard consistency silt & clay with low compressibility stratum exist from which two UDS sample were collected at 12.0 m & 18.0 m depth. The field SPT N value was found to be 32 at 15.0 m depth respectively.
5. From 21.0 m to 24.0 m depth, a non-plastic, very dense compacted clayey silts with none to low plasticity stratum exists. The field SPT N value was found to be 59 at 21.0 m depth respectively.
6. From 24.0 m to 32.0 m (max. explored) depth, non-plastic, very dense compacted Silty sand stratum exist. The field SPT N values were found to be 68 & 77 at 27.0 m & 32.0 m depth respectively.

Pier - (BH NO- 04, CH-21580 m)

1. From N.G.L to 3.0 m depth, a non-plastic, medium compacted clayey silts with none to low plasticity stratum exists from which one DS was collected at 0.5 m depth. The field SPT N value was found to be 16 at 1.50 m depth respectively.
2. From 3.0 m to 12.0 m depth, non-plastic, medium to dense compacted Silty sand stratum exist from which two UDS sample were collected at 3.0 m & 6.0 m depth. The field SPT N values were found to be 18 & 36 at 4.50 m & 9.0 m depth respectively.
3. From 12.0 m to 21.0 m depth, a medium-plastic, hard consistency Silt & clay with low compressibility stratum exists from which two UDS were collected at 12.0 m & 18.0 m depth. The field SPT N value was found to be 52 at 15.0 m depth respectively.
4. From 21.0 m to 32.0 m (max. explored) depth, non-plastic, very dense compacted Silty sand stratum exist. The field SPT N values were found to be 65,76 & 85 at 21.0 m, 27.0 m & 32.0 m depth respectively.

Pier - (BH NO- 05, CH-22160 m)

1. From N.G.L to 3.0 m depth, a non-plastic, medium compacted clayey silts with none to low plasticity stratum exists from which one DS was collected at 0.5 m depth. The field SPT N value was found to be 15 at 1.50 m depth respectively.
2. From 3.0 m to 4.50 m depth, medium-plastic, Clayey sand stratum exist from which one UDS sample was collected at 3.0 m depth.
3. From 4.50 m to 6.0 m depth, non-plastic, clayey silts with none to low plasticity stratum exist. The field SPT N value was found to be 23 at 4.50 m.
4. From 6.0 m to 18.0 m depth, a medium-plastic, medium to dense compacted clayey sand stratum exists from which two UDS were collected at 6.0 m & 12.0 m depth. The field SPT N value were found to be 28 & 50 at 9.0 m & 15.0 m depth respectively.
5. From 18.0 m to 30.0 m depth, a medium-plastic, hard consistency silt and clay with low compressibility stratum exists from which two UDS were collected at 18.0 m & 24.0 m depth. The field SPT N value were found to be 61 & 70 at 21.0 m & 27.0 m depth respectively.

6. From 30.0 m to 32.0 m (max. explored) depth, medium-plastic, very dense compacted clayey sand stratum exist from which one UDS sample was collected at 30.0 m depth. The field SPT N values was found to be 73 at 32.0 m depth respectively.

Pier - (BH NO- 06, CH-22660 m)

1. From N.G.L to 6.0 m depth, a non-plastic, medium compacted clayey silts with none to low plasticity stratum exists from which one DS and one UDS was collected at 0.5 m & 3.0 m depth. The field SPT N value was found to be 15 & 25 at 1.50 m & 4.5 m depth.
2. From 6.0 m to 15.0 m depth, non-plastic, dense compacted Silty sand stratum exist from which two UDS sample were collected at 6.0 m & 12.0 m depth. The Field SPT N value was found to be 39 at 9.0 m Depth,
3. From 15.0 m to 24.0 m depth, non-plastic, dense to very dense clayey silts with none to low plasticity stratum exist from which one UDS was collected at 18.0 m depth. The field SPT N value were found to be 47 & 60 at 15.0 m & 21.0 m depth
4. From 24.0 m to 32.0 m (max. explored) depth, non-plastic, very dense compacted Silty sand stratum exist from which two UDS sample were collected at 24.0 m & 30.0 m depth. The field SPT N values were found to be 71 & 83 at 27.0 m & 32.0 m depth respectively.

Pier - (BH NO- 07, CH-23160 m)

1. From N.G.L to 1.50 m depth, a non-plastic, Silty sand stratum exists from which one DS was collected at 0.5 m depth.
2. From 1.50 m to 3.0 m depth, a non-plastic, medium compacted poorly graded silty sand stratum exists. The field SPT N value was found to be 18 at 1.50 m depth
3. From 3.0 m to 4.50 m depth, a non-plastic, Silty sand stratum exists from which one UDS was collected at 3.0 m depth.
4. From 4.50 m to 6.0 m depth, a non-plastic, dense compacted poorly graded sand stratum exists. The field SPT N value was found to be 36 at 4.50 m depth
5. From 6.0 m to 9.0 m depth, a non-plastic, Silty sand stratum exists from which one UDS was collected at 6.0 m depth.

6. From 9.0 m to 18.0 m depth, medium-plastic, hard consistency Silt & clay with low compressibility stratum exist. The Field SPT N values were found to be 50 & 54 at 9.0 m & 15.0 m Depth.
7. From 18.0 m to 21.0 m depth, a non-plastic, poorly graded Silty sand stratum exists from which one UDS was collected at 18.0 m depth.
8. From 21.0 m to 27.0 m depth, medium-plastic, hard consistency Silt & clay with low compressibility stratum exist from which one UDS sample was collected at 24.0 m depth. The Field SPT N value was found to be 68 at 21.0 m Depth.
9. From 27.0 m to 32.0 m (max. explored) depth, non-plastic, very dense compacted Silty sand stratum exist from which one UDS sample was collected at 30.0 m depth. The field SPT N values were found to be 79 & 88 at 27.0 m & 32.0 m depth respectively.

Pier - (BH NO- 08, CH-23660 m)

1. From N.G.L m to 15.0 m depth, non-plastic, dense to very dense compacted clayey silts with none to low plasticity stratum exist from which one DS & three UDS sample were collected at 0.5 m, 3.0 m, 6.0 m & 12.0 m depth. The Field SPT N values were found to be 50, 51 & 59 at 1.50 m, 4.50 m & 9.0 m Depth.
2. From 15.0 m to 20.0 m (max. explored) depth, medium-plastic, medium to dense compacted clayey sand stratum exist from which one UDS sample was collected at 18.0 m depth. The field SPT N values were found to be 33 & 25 at 15.0 m & 20.0 m depth respectively.

Pier - (BH NO- 09, CH-22705 m)

1. From N.G.L to 3.0 m depth, a non-plastic, loose compacted Clayey silts with none to low plasticity stratum exists from which one DS was collected at 0.5 m depth. The field SPT N value was found to be 5 at 1.50 m depth
2. From 3.0 m to 4.50 m depth, a low-plastic, stiff consistency, inorganic silty clayey soil stratum exists. The field SPT N value was found to be 13 at 3.0 m depth
3. From 4.50 m to 6.0 m depth, a non-plastic, Clayey silts with none to low plasticity stratum exists from which one UDS was collected at 4.50 m depth.
4. From 6.0 m to 9.0 m depth, a non-plastic, medium compacted silty sand stratum exists. The field SPT N value was found to be 19 at 6.0 m depth

5. From 9.0 m to 15.0 m depth, medium-plastic, very stiff consistency Silt & clay with low compressibility stratum exist from which one UDS was collected at 9.0 m depth. The Field SPT N value was found to be 17 at 12.0 m Depth.
6. From 15.0 m to 27.0 m depth, a non-plastic, medium compacted Clayey silts with none to low plasticity stratum exists from which two UDS were collected at 15.0 m & 21.0 m depth. The Field SPT N values were found to be 25 & 29 at 18.0 m & 24.0 m Depth.
7. From 27.0 m to 40.0 m (max. explored) depth, non-plastic, very dense compacted Silty sand stratum exist from which one UDS sample was collected at 27.0 m depth. The field SPT N values were found to be 61,77 & greater than 50 at 30.0 m,33.0 m,36.0 m,39.0 m & 40.0 m depth respectively.

Pier - (BH NO- 10, CH-23205 m)

1. From N.G.L to 12.0 m depth, a non-plastic, loose to medium compacted Silty sand stratum exists from which one DS was collected at 0.5 m depth and three UDS were collected at 1.50 m,4.5 m,9.0 m depth. The field SPT N values were found to be 5 & 11 at 3.0 m & 6.0 m depth
2. From 12.0 m to 15.0 m depth, a low-plastic, stiff consistency, inorganic silty clayey soil stratum exists. The field SPT N value was found to be 13 at 12.0 m depth
3. From 15.0 m to 18.0 m depth, a medium-plastic, silt and clay with low compressibility stratum exists from which one UDS was collected at 15.0 m depth.
4. From 18.0 m to 40.0 m (max. explored) depth, non-plastic, medium to very dense compacted Silty sand stratum exist from which two UDS sample were collected at 21.0 m & 27.0 m depth. The field SPT N values were found to be 17,30,64,77,84 & greater than 50 at 18.0 m,24.0 m,30.0 m,33.0 m,36.0 m,39.0 m & 40.0 m depth respectively.

Pier - (BH NO- 11, CH-23705 m)

1. From N.G.L to 9.0 m depth, a non-plastic, loose to medium compacted Silty sand stratum exists from which one DS was collected at 0.5 m depth and two UDS were collected at 1.50 m & 4.5 m depth. The field SPT N values were found to be 9 & 18 at 3.0 m & 6.0 m depth
2. From 9.0 m to 15.0 m depth, a medium-plastic, very stiff consistency silt and clay with low compressibility stratum exists from which one UDS was collected at 9.0 m depth. The field SPT N value was found to be 26 at 12.0 m depth.

3. From 15.0 m to 40.0 m (max. explored) depth, non-plastic, dense to very dense compacted Silty sand stratum exist from which three UDS sample were collected at 15.0 m,21.0 m & 27.0 m depth. The field SPT N values were found to be 32,37,85 & greater than 50 at 18.0 m,24.0 m,30.0 m,33.0 m,36.0 m,39.0 m & 40.0 m depth respectively.

Pier - (BH NO- 11A, CH-24205 m)

1. From N.G.L to 6.0 m depth, a non-plastic, loose compacted Silty sand stratum exists from which one DS was collected at 0.5 m depth and two UDS were collected at 1.50 m & 4.5 m depth. The field SPT N values were found to be 5 at 3.0 m depth.
2. From 6.0 m to 15.0 m depth, a medium-plastic, stiff consistency silt and clay with low compressibility stratum exists from which one UDS was collected at 9.0 m depth. The field SPT N values were found to be 10 & 12 at 6.0 m & 12.0 m depth.
3. From 15.0 m to 18.0 m depth, a non-plastic, Clayey silts with none to low plasticity stratum exists from which one UDS was collected at 15.0 m depth.
4. From 18.0 m to 36.0 m depth, non-plastic, very dense compacted Silty sand stratum exist. The field SPT N values were found to be 56,67,74 & greater than 50 at 18.0 m,21.0 m,24.0 m,27.0 m,30.0 m & 33.0 m depth respectively.
5. From 36.0 m to 40.0 m (max. explored) depth, very dense compacted Pebble pieces' stratum encountered. The field SPT N values were found to be greater than 50 at 36.0 m,39.0 m & 40.0 m depth respectively.

Pier - (BH NO- 12, CH-24700 m)

1. From N.G.L to 4.5 m depth, a non-plastic, medium to very dense compacted clayey silts with none to low plasticity stratum exists. The field SPT N values were found to be 17,24 & greater than 50 at 1.50 m,3.0 m & 4.50 m depth.
2. From 4.50 m to 6.0 m depth, a Boulder stratum encountered.
3. From 6.0 m to 20.0 m (max. explored) depth, rock stratum encountered. The field SPT N values were found to be greater than 50 at 36.0 m,39.0 m & 40.0 m depth respectively. Core Recovery varies from 16.66 % to 36.66 % and R.Q.D varies from zero to 24.95 %.

7. ABSTRACTOF BEARING/LOAD CARRYING CAPACITY

Table-3

7.1 Load Carrying Capacity of Bored Cast-In-Situ Pile

Location	Dia of pile in (m)	Length of Pile in (m)	Safe Load Carrying Capacity in (Ton)	Recommended safe load carrying capacity in (Ton)	Safe Horizontal Load Carrying Capacity in (Ton)	Recommended Safe Horizontal Load Carrying Capacity in (Ton)

Note*

1. **The actual load carrying capacity of piles depends upon many factors such as the quality of construction of piles, disturbance to sub-soil during construction etc. The influence of these factors is not amenable to theoretical computation. It is therefore, a usual practice to confirm theoretical estimated pile capacity by conducting pile load test on prototype piles-in-situ.**
2. **It is therefore, recommended that few initial load tests be conducted on piles at the site as per Indian standard (IS: 2911, Part IV, 2013) by subjecting the pile to a load level of 2.5 times of the safe load carrying capacity of the pile. It is also advisable to conduct few routine load tests on piles as per (IS: 2911, Part IV, 2013).**
3. **The allowable bearing pressure determined from various B.I.S Codes have been reduced due to likely variation and uncertainties in properties of sub soil determined based on available limited test result.**
4. **Foundation suitable for design may be considered for BH-12.**
5. **SBP has calculated considering the squire footing with size of L=10.0 m& B=8.0 m.**

8.0 Liquefaction Potential

The assessment for liquefaction of soil has been made as per Annexure D. It was revealed that the subsoil from BH-02 to BH-08 & BH-12, is not prone to liquefaction. Further subsoil in BH-9, BH-10 in different stretch of depth is prone to liquefaction hence pile lengths have been increased suitably to account for loss in frictional component of pile capacity.

ANNEXURE -A
BORE LOGS

Consultant:	Geotechnical Investigation Report		Client :
S.M. CONSULTANTS BHUBANESWAR	Job No:830	Report No. SMC-2050	Haryana Rail Infrastructure Development Corporation Ltd

Name of Consultants : M/s S.M Consultants , Bhubaneswar
Name of the client : Haryana Rail Infrastructure Development Corporation Ltd.
Name of Work : Exploring alternate alignments,final location survey,geological mapping, geo-technical investigation, detail design of tunnel & its approaches including viaduct if any and other ancillary work in Sohana-Manesar section of HORC project

Ground surface level : [RL(+) 191.135m]
Type of boring : Rotary Boring
Diameter of boring : 150mm
Inclination : Vertical
Ground water table : 1.50 m below the E.G.L

Abutment(BH NO:02)
Location:Rozaxan toll Naka
CH NO: 21305m

Name of Consultants : M/s S.M.Consultants , Bhubaneswar.
Name of the client : Haryana Rail Infrastructure Development Corporation Ltd.
Name of Work : Exploring alternate alignments, final location survey, geological mapping, geo-technical investigation, detail design of tunnel & its approaches including viaduct if any and other ancillary work in Sohana-Manesar section of HORC project
Ground surface level : [RL(+) 196.637m]
Type of boring : Rotary Boring
Diameter of boring : 150mm
Inclination : Vertical
Ground water table : 6.50 m below the E.G.L

Pier(BH NO:11-A)
Location [illegible]
CH NO: 24205m
Date of boring started:05.12.2021
Date of boring completed:06.12.2021

ANNEXURE -C
CALCULATION OF LOAD CARRYING CAPACITY OF PILE

CALCULATION OF LOAD CARRYING CAPACITY OF PILE

Calculation of load carrying capacity of bored cast in-situ pile considering Abutment (BH NO-02)

Dia = 1.2 m

Length = 23.00 m From Bottom of the Pile Cap

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$\mathbf{Q_u} = \mathbf{R_u} + \mathbf{R_f}$

Where, $\mathbf{R_u}$ = Ultimate Base Resistance

$\mathbf{R_f}$ = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$\mathbf{R_u} = \mathbf{A_p N_c c_p + Ap (0.5 D\gamma N_\gamma + P_D Nq)}$

$= \mathbf{X' + Y'}$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p (0.5 D\gamma N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$\mathbf{R_f} = \mathbf{\Sigma^n_{i=1} \alpha_i c_i A_{si} + \Sigma K P_{Di} \tan \delta_i A_{si}}$

$= \mathbf{X + Y}$ where; $X = \Sigma^n_{i=1} \alpha_i c_i A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1} K_i P_{Di} \tan \delta_i A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2
- D = diameter of the pile shaft, in m
- γ = effective unit weight of the soil at pile tip, in kN/m^2
- P_D = effective overburden pressure at pile tip, in kN/m^2
- $\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
- N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
- K_i = coefficient of Earth pressure applicable for the ith layer.
- P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2
- δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
- A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -02

Levels		Layer	Thickness of the strata	Depth from Bed	Average SPT N value	Bulk Density γ_b	c	ϕ	Compnent (X or Y)
0.000			(m)	(m)		t / m^3	kg / cm^2	(degrees)	
2.000		1	0.00	0.00	---	---	0.00	0

25.000		6	3.00	23.00	---	1.887	0.28	15	X

Design Parameters

Pile Diameter = 1.200 m

K = 1.50

Calculated below is the Avg. Overburden pressure at different layers.

Depth from Bed	Scour Level from Bed	Depth of Strata	Submerged Density γ_{sub}	Overburden Pressure of thickness of the strata	Cumulative Overburden Pressure	Avg. Overburden Pressure of ith layer (thickness of the strata)
(m)	(m)	(m)	t/m^3	t/m^2	t/m^2	t/m^2
0.00	2.000	0.00	0.000	0.000	0.000	0.00
4.00		4.00	1.000	4.000	4.000	2.00
10.00		6.00	1.000	6.000	10.000	7.00
16.00		6.00	1.000	6.000	16.000	13.00
20.00		4.00	1.000	4.000	18.000	17.00
23.00		3.00	1.000	3.000	18.000	18.00

No. of Zones Considered ***6***

Q_{safe} due friction

Zone	Compo nent (X or	Depth	A_{si}	α	X	Y	$Q_u = X + Y$	Factor of Safety	Q_{safe}
		(m)	(m^2)		$\alpha C' A_s$	$K P_{Di} \tan\delta A_{si}$	t		t
Zone I	0	0.00	0.00	0.0	0.0	0.000	**527.233**	**2.500**	**210.893**
Zone II	X	4.00	15.08	1.0	46.8	7.977			
Zone III	X	6.00	22.62	1.0	65.6	46.166			
Zone IV	X	6.00	22.62	1.0	63.3	77.774			
Zone V	X	4.00	15.08	1.0	45.2	60.904			
Zone VI	X	3.00	11.31	1.0	31.7	81.822			

Q_{safe} due to end bearing

End Bearing Capacity of pile at founding level

For c-ϕ Soil

$\mathbf{A_p N_c C_p + A_p (0.5 D \gamma N_\gamma + P_d N_q)}$

Where

End Bearing Capacity of pile at founding level		
For Cohesive Soil		
$A_p N_c C_p$		
Ap	=	1.131
Nc	=	9.000
Cp	=	2.80
B.Capacity	=	**28.50**

and

End Bearing Capacity of pile at founding level		
For Granular Soil		
$Ap (0.5D\gamma N_\gamma + P_d N_q)$		
Ap	=	1.131
D	=	1.200
Pd	=	18.00
γ	=	1.00
ϕ	=	15.00
N_q	=	10.00
N_γ	=	2.65
B.Capacity	=	**205.37**

ϕ		Nγ
15		2.65
20		5.39

Hence, B. Capacity = 233.87

Q_{safe} = **93.550** t

Total Q_{safe} = 210.9 + 93.55

= **304.44** t

1. Density of concrete = ***2.50*** ***t/m^3***
2. Salfe weight of pile (Buoyant) = ***39.02*** ***t***
3. Net bearing capacity of pile = ***265.42*** ***t***

say ***265.00*** ***t***

Hence, the vertical Load carrying capacity of the pile is taken as **265 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1.	Pile Diameter	=	1.200	m	
2.	Concrete design mix strength	=	35	Mpa	(Assume)
3.	Modulus of elasticity of Concrete (E_c)	=	5000 x sqrt (35)		
		=	295804.0	kg / cm^2	
4.	Moment of Inertia (I)	=	$\Pi d^4 / 64$		
		=	0.10179	m^4	
		=	10178760	cm^4	
5.	Embeded Length of Pile (L_e)	=	23.00	m	> 4T 12.79237763 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.90 kg/cm^3

T = 319.81 cm
= 3.198 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.199
= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 3.199
= **7.04** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{3 E I}$$

Fixed Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{12 E I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top; $$Q = \frac{12 EI Y}{(L_1 + L_f)^3}$$

= 51869.05 kg
= **52** t

Hence, the horizontal Load carrying capacity of the pile is taken as **52 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.
In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4)\times D^2\times L\times(2.5-1)$ gm

Frictional resistance = 527.23 T

W_p = 39.024 T

so Q_{tu} = 390.512 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

130.17 T

SAY 130.00 T

CALCULATION OF LOAD CARRYING CAPACITY OF PILE

Calculation of load carrying capacity of bored cast in-situ pile considering

Abutment (BH NO-02)

Dia = 1.2 m

Length = 25.00 m **From Bottom of the Pile Cap**

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$Q_u = R_u + R_f$

Where, R_u = Ultimate Base Resistance

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$R_u = A_p N_c c_p + Ap (0.5\ D\gamma\ N_\gamma + P_D Nq)$

$= X' + Y'$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p (0.5\ D\gamma\ N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$R_f = \Sigma^n_{i=1}\ \alpha_i\ c_i\ A_{si} + \Sigma\ K\ P_{Di}\ \tan\delta_i\ A_{si}$

$= X + Y$ where; $X = \Sigma^n_{i=1} \alpha_i\ c_i\ A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1}\ K_i\ P_{Di}\ \tan\delta_i\ A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2
- D = diameter of the pile shaft, in m
- γ = effective unit weight of the soil at pile tip, in kN/m^2
- P_D = effective overburden pressure at pile tip, in kN/m^2
- $\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
- N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
- K_i = coefficient of Earth pressure applicable for the ith layer.
- P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2
- δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
- A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -02

Q_{safe} due to end bearing

End Bearing Capacity of pile at founding level
For c-ϕ Soil
$\mathbf{A_p N_c C_p + A_p (0.5 D \gamma N_\gamma + P_d N_q)}$

Where

End Bearing Capacity of pile at founding level		
For Cohesive Soil		
$\mathbf{A_p N_c C_p}$		
Ap	=	1.131
Nc	=	9.000
Cp	=	2.80
B.Capacity	=	**28.50**

and

End Bearing Capacity of pile at founding level		
For Granular Soil		
$\mathbf{Ap\,(0.5D\gamma N_\gamma + P_d N_q)}$		
Ap	=	1.131
D	=	1.200
Pd	=	18.00
γ	=	1.00
ϕ	=	15.00
N_q	=	10.00
N_γ	=	2.65
B.Capacity	=	**205.37**

ϕ		$N\gamma$
15		2.65
20		5.39

Hence, B. Capacity = 233.87

Q_{safe} = **93.550** t

Total Q_{safe} = 241.16 + 93.55
= **334.71** t

1. Density of concrete = ***2.50*** ***t/m^3***
2. Salfe weight of pile (Buoyant) = ***42.41 t***
3. Net bearing capacity of pile = ***292.29 t***

say ***292.00 t***

Hence, the vertical Load carrying capacity of the pile is taken as **292 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1.	Pile Diameter	=	1.200	m	
2.	Concrete design mix strength	=	35	Mpa	(Assume)
3.	Modulus of elasticity of Concrete (E_c)	=	5000 x sqrt (35)		
		=	295804.0	kg / cm^2	
4.	Moment of Inertia (I)	=	$\Pi\ d^4 / 64$		
		=	0.10179	m^4	
		=	10178760	cm^4	
5.	Embeded Length of Pile (L_e)	=	25.00	m	> 4T
					12.79237763 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get	n_h	=	0.90	kg/cm^3
	T	=	319.81	cm
		=	3.198	m
Free Length of pile (L_1)		=	Pile cap bottom Level - Scour Level	
	L_1	=	**0.000**	m
Hence;	L_1 / T	=	0 / 3.199	
		=	0.00	

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

	L_f / T	=	2.20	for pile in sand
Hence;				
Equivalent Cantilever Length	L_f	=	2.2 x 3.199	
		=	**7.04**	m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{3\,E\,I}$$

Fixed Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{12\,E\,I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top;

$$Q = \frac{12\,EI\,Y}{(L_1 + L_f)^3}$$

= 51869.05 kg

= **52** t

Hence, the horizontal Load carrying capacity of the pile is taken as **52 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.
In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4)\times D^2 \times L \times (2.5-1)$ gm

Frictional resistance = 602.89 T

W_p = 42.417 T

so Q_{tu} = 444.344 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$Q_u = R_u + R_f$

Where, R_u = Ultimate Base Resistance

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$R_u = A_p N_c c_p + Ap\,(0.5\, D\gamma\, N_\gamma + P_D Nq)$

$= X' + Y'$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p (0.5\, D\gamma\, N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$R_f = \Sigma^n_{i=1}\, \alpha_i\, c_i\, A_{si} + \Sigma\, K\, P_{Di} \tan \delta_i\, A_{si}$

$= X + Y$ where; $X = \Sigma^n_{i=1} \alpha_i\, c_i\, A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1}\, K_i\, P_{Di} \tan \delta_i\, A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2
- D = diameter of the pile shaft, in m
- γ = effective unit weight of the soil at pile tip, in kN/m^2
- P_D = effective overburden pressure at pile tip, in kN/m^2
- $\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
- N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
- K_i = coefficient of Earth pressure applicable for the ith layer.
- P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2
- δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
- A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -03

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$R_u = A_p N_c c_p + A_p (0.5 D\gamma N_\gamma + P_D N_q)$

$= X' + Y'$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p (0.5 D\gamma N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$R_f = \Sigma^n_{i=1} \alpha_i c_i A_{si} + \Sigma K P_{Di} \tan \delta_i A_{si}$

$= X + Y$ where; $X = \Sigma^n_{i=1} \alpha_i c_i A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1} K_i P_{Di} \tan \delta_i A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2
- D = diameter of the pile shaft, in m
- γ = effective unit weight of the soil at pile tip, in kN/m^2
- P_D = effective overburden pressure at pile tip, in kN/m^2
- $\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
- N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
- K_i = coefficient of Earth pressure applicable for the ith layer.
- P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2
- δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
- A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -04

Levels		Layer	Thickness of the strata	Depth from Bed	Average SPT N value	Bulk Density γ_b	c	ϕ	Compnent (X or Y)

Q_{safe} due to end bearing

End Bearing Capacity of pile at founding level
For c-ϕ Soil
$A_p N_c C_p + A_p (0.5 D \gamma N_\gamma + P_d N_q)$

Where

End Bearing Capacity of pile at founding level		
For Cohesive Soil		
$A_p N_c C_p$		
Ap	=	1.131
Nc	=	9.000
Cp	=	0.40
B.Capacity	=	**4.07**

and

End Bearing Capacity of pile at founding level		
For Granular Soil		
Ap (0.5DγN$_\gamma$+P$_d$N$_q$)		
Ap	=	1.131
D	=	1.200
Pd	=	18.00
γ	=	1.00
ϕ	=	25.00
N_q	=	10.00
N_γ	=	10.88
B.Capacity	=	**210.96**

ϕ		Nγ
25		10.88
30		22.40

Hence, B. Capacity = 215.03

Q_{safe} = **86.012** t

Total Q_{safe} = 175.88 + 86.02
= **261.89** t

1. Density of concrete = ***2.50*** ***t/m^3***
2. Salfe weight of pile (Buoyant) = ***33.93*** ***t***
3. Net bearing capacity of pile = ***227.96*** ***t***
say ***228.00*** ***t***

Hence, the vertical Load carrying capacity of the pile is taken as **228 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1. Pile Diameter = 1.200 m
2. Concrete design mix strength = 35 Mpa (Assume)
3. Modulus of elasticity of Concrete (E_c) = 5000 x sqrt (35)
   = 295804.0 kg / cm^2
4. Moment of Inertia (I) = $\Pi d^4 / 64$
   = 0.10179 m^4
   = 10178760.2 cm^4
5. Embeded Length of Pile (L_e) = 20.00 m > 4T
   15.19998131 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.38 kg/cm^3

T = 380.00 cm
= 3.800 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.8
= 0.00

Therefore from the graph we read the corresponding value of " **L_f / T** ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 3.8
= **8.36** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{3 E I}$$

Fixed Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{12 E I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top; $Q = \frac{12 EI Y}{(L_1 + L_f)^3}$

= 30919.53 kg
= **31** t

Hence, the horizontal Load carrying capacity of the pile is taken as **31 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.
In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$\mathbf{Q_{tu} = (2/3)\ rd\ of\ frictional\ resistance + W_p}$$

where W_p = Submerged weight of pile = $(3.141/4)\times D^2\times L\times(2.5-1)$ gm

Frictional resistance = 439.70 T

W_p = 33.934 T

so Q_{tu} = 327.064 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

109.02 T

SAY 109.00 T

CALCULATION OF LOAD CARRYING CAPACITY OF PILE

Calculation of load carrying capacity of bored cast in-situ pile considering

Pier (BH NO-04)

Dia = 1.2 m

Length = 23.00 m From Bottom of the Pile Cap

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$\mathbf{Q_u} = \mathbf{R_u} + \mathbf{R_f}$

Where, $\mathbf{R_u}$ = Ultimate Base Resistance

$\mathbf{R_f}$ = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$\mathbf{R_u} = \mathbf{A_p N_c c_p + Ap\,(0.5\,D\gamma\,N_\gamma + P_D Nq)}$

$= \mathbf{X' + Y'}$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p\,(0.5\,D\gamma\,N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$\mathbf{R_f} = \mathbf{\Sigma^n_{i=1}\,\alpha_i\,c_i\,A_{si} + \Sigma\,K\,P_{Di}\,\tan\delta_i\,A_{si}}$

$= \mathbf{X + Y}$ where; $X = \Sigma^n_{i=1}\alpha_i\,c_i\,A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1}\,K_i\,P_{Di}\,\tan\delta_i\,A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2

N_γ	=	10.88
B.Capacity	=	**210.96**

ϕ		Nγ
25		10.88
30		22.40

Hence, B. Capacity = 215.03

Q_{safe} = **86.012** t

Total Q_{safe} = 270.81 + 86.02
= **356.82** t

1. Density of concrete = ***2.50*** ***t/m^3***
2. Salfe weight of pile (Buoyant) = ***42.41*** ***t***
3. Net bearing capacity of pile = ***314.41*** ***t***
say ***314.00*** ***t***

Hence, the vertical Load carrying capacity of the pile is taken as **314 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1.	Pile Diameter	=	1.200	m	
2.	Concrete design mix strength	=	35	Mpa	(Assume)
3.	Modulus of elasticity of Concrete (E_c)	=	5000 x sqrt (35)		
		=	295804.0	kg / cm^2	
4.	Moment of Inertia (I)	=	Π d^4 / 64		
		=	0.10179	m^4	
		=	10178760.2	cm^4	
5.	Embeded Length of Pile (L_e)	=	25.00	m	> 4T
					15.19998131 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.38 kg/cm^3

T = 380.00 cm
= 3.800 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.8
= 0.00

Therefore from the graph we read the corresponding value of " **L_f / T** ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 3.8
= **8.36** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{3 E I}$$

Fixed Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{12 E I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top;

$$Q = \frac{12 EI Y}{(L_1 + L_f)^3}$$

= 30919.53 kg
= **31** t

Hence, the horizontal Load carrying capacity of the pile is taken as **31 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.

In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4) \times D^2 \times L \times (2.5-1)$ gm

Frictional resistance = 677.02 T

W_p = 42.417 T

so Q_{tu} = 493.761 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

164.59 T

SAY 165.00 T

CALCULATION OF LOAD CARRYING CAPACITY OF PILE

Calculation of load carrying capacity of bored cast in-situ pile considering

Dia = 1.2 m

Length = 25.00 m From Bottom of the Pile Cap

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$Q_u = R_u + R_f$

Where, R_u = Ultimate Base Resistance

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$R_u = A_p N_c c_p + Ap\,(0.5\, D\gamma\, N_\gamma + P_D N q)$

$= X' + Y'$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p\,(0.5\, D\gamma\, N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$R_f = \Sigma^n{}_{i=1}\, \alpha_i\, c_i\, A_{si} + \Sigma\, K\, P_{Di} \tan \delta_i\, A_{si}$

$= X + Y$ where; $X = \Sigma^n{}_{i=1} \alpha_i\, c_i\, A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n{}_{i=1}\, K_i\, P_{Di} \tan \delta_i\, A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2
- D = diameter of the pile shaft, in m
- γ = effective unit weight of the soil at pile tip, in kN/m^2
- P_D = effective overburden pressure at pile tip, in kN/m^2
- $\Sigma^n{}_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
- N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
- K_i = coefficient of Earth pressure applicable for the ith layer.
- P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2
- δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
- A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -05

Q_{safe} due to end bearing

End Bearing Capacity of pile at founding level
For c-ϕ Soil
$\mathbf{A_p N_c C_p + A_p (0.5 D \gamma N_\gamma + P_d N_q)}$

Where

End Bearing Capacity of pile at founding level For Cohesive Soil $A_p N_c C_p$		
Ap	=	1.131
Nc	=	9.000
Cp	=	1.30
B.Capacity	=	**13.23**

and

End Bearing Capacity of pile at founding level For Granular Soil $Ap (0.5D\gamma N_\gamma + P_d N_q)$		
Ap	=	1.131
D	=	1.200
Pd	=	18.00
γ	=	1.86
ϕ	=	18.00
N_q	=	10.00
N_γ	=	4.29
B.Capacity	=	**209.00**

ϕ		$N\gamma$
15		2.65
20		5.39

Hence, B. Capacity = 222.24

Q_{safe} = **88.894** t

Total Q_{safe} = 238.58 + 88.9
= **327.47** t

1. Density of concrete = ***2.50*** ***t/m³***
2. Salfe weight of pile = ***56.55*** ***t***
3. Net bearing capacity of pile = ***270.92*** ***t***
say ***271.00*** ***t***

Hence, the vertical Load carrying capacity of the pile is taken as **271 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1. Pile Diameter = 1.200 m
2. Concrete design mix strength = 35 Mpa (Assume)
3. Modulus of elasticity of Concrete (E_c) = 5000 x sqrt (35)
   = 295804.0 kg / cm^2
4. Moment of Inertia (I) = $\Pi\ d^4 / 64$
   = 0.10179 m^4
   = 10178760.2 cm^4
5. Embeded Length of Pile (L_e) = 20.00 m > 4T
   14.69458314 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.45 kg/cm^3

T = 367.36 cm
= 3.674 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.674
= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 3.674
= **8.08** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q\ (L_1 + L_f)^3}{3\ E\ I}$$

Fixed Head Piles

$$Y = \frac{Q\ (L_1 + L_f)^3}{12\ E\ I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top;

$$Q = \frac{12\ EI\ Y}{(L_1 + L_f)^3}$$

= 34220.81 kg
= **34** t

Hence, the horizontal Load carrying capacity of the pile is taken as **34 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.

In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4) \times D^2 \times L \times (2.5-1)$ gm

Frictional resistance = 596.44 T

W_p = 33.934 T

so Q_{tu} = 431.561 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

143.85 T

SAY 144.00 T

CALCULATION OF LOAD CARRYING CAPACITY OF PILE

Calculation of load carrying capacity of bored cast in-situ pile considering

Pier (BH NO-06)

Dia = **1.2** **m**

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

Q_u = R_u + R_f

Where, R_u = Ultimate Base Resistance

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

R_u = $A_p N_c c_p + Ap\,(0.5\,D\gamma\,N_\gamma + P_D Nq)$

= X' + Y' where; X' = $A_p N_c c_p$ *For Cohesive Soil*

Y' = $A_p\,(0.5\,D\gamma\,N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

R_f = $\Sigma^n_{i=1}\,\alpha_i\,c_i\,A_{si} + \Sigma\,K\,P_{Di}\tan\delta_i\,A_{si}$

= X + Y where; X = $\Sigma^n_{i=1}\alpha_i\,c_i\,A_{si}$ *For Cohesive Soil*

Y = $\Sigma^n_{i=1}\,K_i\,P_{Di}\tan\delta_i\,A_{si}$ *For Granular Soil*

Where;

A_p	=	cross sectional area of pile tip, in m^2
N_c	=	bearing capacity factor, may be taken as " 9 "
c_p	=	average cohesion at pile tip, in kN/m^2
α_i	=	adhesion factor for the ith layer depending on the consistency of soil
c_i	=	average cohesion for the ith layer, in kN/m^2
A_p	=	cross sectional area of pile tip, in m^2
D	=	diameter of the pile shaft, in m
γ	=	effective unit weight of the soil at pile tip, in kN/m^2
P_D	=	effective overburden pressure at pile tip, in kN/m^2
$\Sigma^n_{i=1}$	=	summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
N_γ & N_q	=	bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
K_i	=	coefficient of Earth pressure applicable for the ith layer.
P_{Di}	=	effective overburden pressure for the " i^{th} " layer, in kN/m^2
δ	=	angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
A_{si}	=	surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -06

Levels		Layer	Thickness of the strata	Depth from Bed	Average SPT N value	Bulk Density γ_b	c	ϕ	Compnent (X or Y)

N_γ	=	7.59
B.Capacity	=	**213.25**

ϕ		Nγ
20		5.39
25		10.88

Hence, B. Capacity = 221.39

Q_{safe} = **88.556** t

Total Q_{safe} = 300.81 + 88.56
= **389.37** t

1. Density of concrete = ***2.50*** ***t/m***[3]
2. Salfe weight of pile = ***65.03 t***
3. Net bearing capacity of pile = ***324.34 t***
say ***324.00 t***

Hence, the vertical Load carrying capacity of the pile is taken as **324 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1.	Pile Diameter	=	1.200	m	
2.	Concrete design mix strength	=	35	Mpa	(Assume)
3.	Modulus of elasticity of Concrete (E_c)	=	5000 x sqrt (35)		
		=	295804.0	kg / cm^2	
4.	Moment of Inertia (I)	=	$\Pi\ d^4 / 64$		
		=	0.10179	m^4	
		=	10178760.2	cm^4	
5.	Embeded Length of Pile (L_e)	=	23.00	m	> 4T 14.69458314 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.45 kg/cm^3

T = 367.36 cm
= 3.674 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.674
= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 3.674
= **8.08** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{3\,E\,I}$$

Fixed Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{12\,E\,I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top;

$$Q = \frac{12\,EI\,Y}{(L_1 + L_f)^3}$$

= 34220.81 kg
= **34** t

Hence, the horizontal Load carrying capacity of the pile is taken as **34 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.
In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4) \times D^2 \times L \times (2.5-1)$ gm

Frictional resistance = 752.02 T

W_p = 39.024 T

so Q_{tu} = 540.373 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

   = 295804.0 kg / cm^2
4. Moment of Inertia (I) = Π d^4 / 64
   = 0.10179 m^4
   = 10178760.2 cm^4
5. Embeded Length of Pile (L_e) = 20.00 m > 4T
   14.38817702 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.50 kg/cm^3

T = 359.70 cm
= 3.597 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level
L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.598
= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;
Equivalent Cantilever Length L_f = 2.2 x 3.598
= **7.91** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{3\,E\,I}$$

Fixed Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{12\,E\,I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top;

$$Q = \frac{12\,EI\,Y}{(L_1 + L_f)^3}$$

= 36453.97 kg
= **36** t

Hence, the horizontal Load carrying capacity of the pile is taken as **36 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.

In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4) \times D^2 \times L \times (2.5-1)$ gm

Frictional resistance = 557.41 T

W_p = 33.934 T

so Q_{tu} = 405.540 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

135.18 T

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$\mathbf{Q_u} = \mathbf{R_u} + \mathbf{R_f}$

Where, $\mathbf{R_u}$ = Ultimate Base Resistance

$\mathbf{R_f}$ = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$\mathbf{R_u} = \mathbf{A_p N_c c_p + Ap (0.5 D\gamma N_\gamma + P_D Nq)}$

$= \mathbf{X' + Y'}$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p (0.5 D\gamma N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$\mathbf{R_f} = \mathbf{\Sigma^n_{i=1} \alpha_i c_i A_{si} + \Sigma K P_{Di} \tan \delta_i A_{si}}$

$= \mathbf{X + Y}$ where; $X = \Sigma^n_{i=1} \alpha_i c_i A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1} K_i P_{Di} \tan \delta_i A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2
- D = diameter of the pile shaft, in m
- γ = effective unit weight of the soil at pile tip, in kN/m^2
- P_D = effective overburden pressure at pile tip, in kN/m^2
- $\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
- N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
- K_i = coefficient of Earth pressure applicable for the ith layer.
- P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2
- δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
- A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -07

Q $_{safe}$ due to end bearing

End Bearing Capacity of pile at founding level

For c-ϕ Soil

$\mathbf{A_p\ N_c\ C_p + A_p\ (0.5\ D\ \gamma\ N_\gamma + P_d\ N_q)}$

Where

End Bearing Capacity of pile at founding level		
For Cohesive Soil		
$\mathbf{A_p\ N_c\ C_p}$		
Ap	=	1.131
Nc	=	9.000
Cp	=	1.50
B.Capacity	=	**15.27**

and

End Bearing Capacity of pile at founding level		
For Granular Soil		
$\mathbf{Ap\ (0.5D\gamma N_\gamma + P_d N_q)}$		
Ap	=	1.131
D	=	1.200
Pd	=	18.00
γ	=	1.00
ϕ	=	14.00
N_q	=	10.00
N_γ	=	2.36
B.Capacity	=	**205.18**

ϕ		Nγ
10		1.22
15		2.65

Hence, B. Capacity = 220.45

Q_{safe} = **88.179** t

Total Q_{safe} = 186.46 + 88.18

= **274.64** t

1. Density of concrete = ***2.50*** ***t/m*** ^{3}
2. Salfe weight of pile (Buoyant) = ***42.41*** ***t***
3. Net bearing capacity of pile = ***232.23*** ***t***

say ***232.00*** ***t***

Hence, the vertical Load carrying capacity of the pile is taken as **232 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1.	Pile Diameter	=	1.200	m	
2.	Concrete design mix strength	=	35	Mpa	(Assume)
3.	Modulus of elasticity of Concrete (E_c)	=	5000 x sqrt (35)		
		=	295804.0	kg / cm^2	
4.	Moment of Inertia (I)	=	$\Pi d^4 / 64$		
		=	0.10179	m^4	
		=	10178760.2	cm^4	
5.	Embeded Length of Pile (L_e)	=	25.00	m	> 4T
					16.8056071 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.23 kg/cm^3

T = 420.14 cm

= 4.201 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 4.202

= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 4.202

= **9.24** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{3 E I}$$

Fixed Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{12 E I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top;
$$Q = \frac{12 EI Y}{(L_1 + L_f)^3}$$

= 22877.02 kg

= **23** t

Hence, the horizontal Load carrying capacity of the pile is taken as **23 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.

In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4)\times D^2 \times L \times (2.5-1)$ gm

Frictional resistance = 466.15 T

W_p = 42.417 T

so Q_{tu} = 353.184 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

117.73 T

SAY 118.00 T

CALCULATION OF LOAD CARRYING CAPACITY OF PILE

Calculation of load carrying capacity of bored cast in-situ pile considering

Pier (BH NO-09)

Dia = 1.2 m

Length = 28.00 m **From Bottom of the Pile Cap**

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$Q_u = R_u + R_f$

Where, R_u = Ultimate Base Resistance

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$R_u = A_p N_c c_p + Ap (0.5 D\gamma N_\gamma + P_D Nq)$

$= X' + Y'$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p (0.5 D\gamma N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$R_f = \Sigma^n_{i=1} \alpha_i c_i A_{si} + \Sigma K P_{Di} \tan \delta_i A_{si}$

$= X + Y$ where; $X = \Sigma^n_{i=1} \alpha_i c_i A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1} K_i P_{Di} \tan \delta_i A_{si}$ *For Granular Soil*

Where;

A_p = cross sectional area of pile tip, in m^2

N_c = bearing capacity factor, may be taken as " 9 "

c_p = average cohesion at pile tip, in kN/m^2

α_i = adhesion factor for the ith layer depending on the consistency of soil

c_i = average cohesion for the ith layer, in kN/m^2

A_p = cross sectional area of pile tip, in m^2

D = diameter of the pile shaft, in m

γ = effective unit weight of the soil at pile tip, in kN/m^2

P_D = effective overburden pressure at pile tip, in kN/m^2

$\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.

N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.

K_i = coefficient of Earth pressure applicable for the ith layer.

P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2

δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).

A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -09

CALCULATION OF LOAD CARRYING CAPACITY OF PILE

Calculation of load carrying capacity of bored cast in-situ pile considering

Pier (BH NO-10)

Dia = 1.2 m

Length = 36.00 m **From Bottom of the Pile Cap**

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$\mathbf{Q_u} = \mathbf{R_u} + \mathbf{R_f}$

Where, R_u = Ultimate Base Resistance

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$\mathbf{R_u} = \mathbf{A_p N_c c_p + Ap\,(0.5\,D\gamma N_\gamma + P_D Nq)}$

$= \mathbf{X' + Y'}$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p\,(0.5\,D\gamma N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$\mathbf{R_f} = \mathbf{\Sigma^n_{i=1}\,\alpha_i c_i A_{si} + \Sigma K P_{Di} \tan\delta_i A_{si}}$

$= \mathbf{X + Y}$ where; $X = \Sigma^n_{i=1}\alpha_i c_i A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1} K_i P_{Di} \tan\delta_i A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2
- D = diameter of the pile shaft, in m
- γ = effective unit weight of the soil at pile tip, in kN/m^2
- P_D = effective overburden pressure at pile tip, in kN/m^2
- $\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
- N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
- K_i = coefficient of Earth pressure applicable for the ith layer.
- P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2
- δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
- A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -10

Due to liquefaction upto 18.0 m, Ultimate load capacity due to friction up to a depth of 18.0 m has not been considered.

Q_{safe} due to end bearing

End Bearing Capacity of pile at founding level
For c-ϕ Soil
$A_p N_c C_p + A_p (0.5 D \gamma N_\gamma + P_d N_q)$

Where

End Bearing Capacity of pile at founding level		
For Cohesive Soil		
$A_p N_c C_p$		
Ap	=	1.131
Nc	=	9.000
Cp	=	0.40
B.Capacity	=	**4.07**

and

End Bearing Capacity of pile at founding level		
For Granular Soil		
Ap (0.5DγN_γ+$P_d N_q$)		
Ap	=	1.131
D	=	1.200
Pd	=	18.00
γ	=	1.00
ϕ	=	24.00
N_q	=	10.00
N_γ	=	9.78
B.Capacity	=	**210.21**

ϕ		$N\gamma$
20		5.39
25		10.88

Hence, B. Capacity = 214.28

Q_{safe} = **85.714** t

Total Q_{safe} = 360.79 + 85.72
= **446.50** t

1. Density of concrete = ***2.50*** ***t/m³***
2. Salfe weight of pile (Buoyant) = ***61.07*** ***t***
3. Net bearing capacity of pile = ***385.42*** ***t***
say ***385.00*** ***t***

Hence, the vertical Load carrying capacity of the pile is taken as **385 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1. Pile Diameter = 1.200 m
2. Concrete design mix strength = 35 Mpa (Assume)
3. Modulus of elasticity of Concrete (E_c) = 5000 x sqrt (35)
   = 295804.0 kg / cm^2
4. Moment of Inertia (I) = $\Pi\ d^4 / 64$
   = 0.10179 m^4
   = 10178760.2 cm^4
5. Embeded Length of Pile (L_e) = 36.00 m > 4T
   27.39010985 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.02 kg/cm^3

T = 684.75 cm
= 6.848 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 6.848
= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 6.848
= **15.06** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{3\,E\,I}$$

Fixed Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{12\,E\,I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top;

$$Q = \frac{12\,EI\,Y}{(L_1 + L_f)^3}$$

= 5284.22 kg
= **5** t

Hence, the horizontal Load carrying capacity of the pile is taken as **5 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.

In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4) \times D^2 \times L \times (2.5-1)$ gm

Frictional resistance = 901.95 T

W_p = 61.080 T

so Q_{tu} = 662.383 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

220.79 T

Q_{safe} due to end bearing

End Bearing Capacity of pile at founding level

For c-ϕ Soil

$\mathbf{A_p N_c C_p + A_p (0.5 D \gamma N_\gamma + P_d N_q)}$

Where

End Bearing Capacity of pile at founding level For Cohesive Soil		
$A_p N_c C_p$		
Ap	=	1.131
Nc	=	9.000
Cp	=	0.20
B.Capacity	=	**2.04**

and

End Bearing Capacity of pile at founding level For Granular Soil		
Ap ($0.5D\gamma N_\gamma + P_d N_q$)		
Ap	=	1.131
D	=	1.200
Pd	=	18.00
γ	=	1.00
ϕ	=	26.00
N_q	=	13.00
N_γ	=	13.18
B.Capacity	=	**273.59**

ϕ		$N\gamma$
25		10.88
30		22.40

Hence, B. Capacity = 275.63

Q_{safe} = **110.252** t

Total Q_{safe} = 268.79 + 110.26

= **379.03** t

1. Density of concrete = ***2.50*** ***t/m*** ***3***
2. Salfe weight of pile (Buoyant) = ***39.02*** ***t***
3. Net bearing capacity of pile = ***340.01*** ***t***

say ***340.00*** ***t***

Hence, the vertical Load carrying capacity of the pile is taken as **340 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1. Pile Diameter = 1.200 m
2. Concrete design mix strength = 35 Mpa (Assume)
3. Modulus of elasticity of Concrete (E_c) = 5000 x sqrt (35)
   = 295804.0 kg / cm^2
4. Moment of Inertia (I) = $\Pi\ d^4 / 64$
   = 0.10179 m^4
   = 10178760.2 cm^4
5. Embeded Length of Pile (L_e) = 23.00 m > 4T
   16.52767527 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.25 kg/cm^3

T = 413.19 cm
= 4.132 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 4.132
= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 4.132
= **9.09** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q\ (L_1 + L_f)^3}{3\ E\ I}$$

Fixed Head Piles

$$Y = \frac{Q\ (L_1 + L_f)^3}{12\ E\ I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top; $$Q = \frac{12\ EI\ Y}{(L_1 + L_f)^3}$$

= 24050.65 kg
= **24** t

Hence, the horizontal Load carrying capacity of the pile is taken as **24 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.

In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4)\times D^2\times L\times(2.5-1)$ gm

Frictional resistance = 671.95 T

W_p = 39.024 T

so Q_{tu} = 486.993 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

162.33 T

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

$\mathbf{Q_u} = \mathbf{R_u} + \mathbf{R_f}$

Where, R_u = Ultimate Base Resistance

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

$\mathbf{R_u} = \mathbf{A_p N_c c_p + Ap (0.5 D\gamma N_\gamma + P_D Nq)}$

$= X' + Y'$ where; $X' = A_p N_c c_p$ *For Cohesive Soil*

$Y' = A_p (0.5 D\gamma N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

$\mathbf{R_f} = \mathbf{\Sigma^n_{i=1} \alpha_i c_i A_{si} + \Sigma K P_{Di} \tan \delta_i A_{si}}$

$= X + Y$ where; $X = \Sigma^n_{i=1} \alpha_i c_i A_{si}$ *For Cohesive Soil*

$Y = \Sigma^n_{i=1} K_i P_{Di} \tan \delta_i A_{si}$ *For Granular Soil*

Where;
- A_p = cross sectional area of pile tip, in m^2
- N_c = bearing capacity factor, may be taken as " 9 "
- c_p = average cohesion at pile tip, in kN/m^2
- α_i = adhesion factor for the ith layer depending on the consistency of soil
- c_i = average cohesion for the ith layer, in kN/m^2
- A_p = cross sectional area of pile tip, in m^2
- D = diameter of the pile shaft, in m
- γ = effective unit weight of the soil at pile tip, in kN/m^2
- P_D = effective overburden pressure at pile tip, in kN/m^2
- $\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.
- N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.
- K_i = coefficient of Earth pressure applicable for the ith layer.
- P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2
- δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).
- A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Q_{safe} due to end bearing

End Bearing Capacity of pile at founding level
For c-ϕ Soil
$A_p N_c C_p + A_p (0.5 D \gamma N_\gamma + P_d N_q)$

Where

End Bearing Capacity of pile at founding level		
For Cohesive Soil		
$A_p N_c C_p$		
Ap	=	1.131
Nc	=	9.000
Cp	=	0.20
B.Capacity	=	**2.04**

and

End Bearing Capacity of pile at founding level		
For Granular Soil		
Ap $(0.5D\gamma N_{\gamma+} P_d N_q)$		
Ap	=	1.131
D	=	1.200
Pd	=	18.00
γ	=	1.00
ϕ	=	25.00
N_q	=	10.00
N_γ	=	10.88
B.Capacity	=	**210.96**

ϕ		Nγ
25		10.88
30		22.40

Hence, B. Capacity = 212.99

Q_{safe} = **85.198** t

Total Q_{safe} = 244.75 + 85.2
= **329.94** t

1. Density of concrete = ***2.50*** ***t/m^3***
2. Salfe weight of pile (Buoyant) = ***39.02*** ***t***
3. Net bearing capacity of pile = ***290.92*** ***t***

say ***291.00*** ***t***

Hence, the vertical Load carrying capacity of the pile is taken as **291 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1.	Pile Diameter	=	1.200	m	
2.	Concrete design mix strength	=	35	Mpa	(Assume)
3.	Modulus of elasticity of Concrete (E_c)	=	5000 x sqrt (35)		
		=	295804.0	kg / cm^2	
4.	Moment of Inertia (I)	=	$\Pi d^4 / 64$		
		=	0.10179	m^4	
		=	10178760.2	cm^4	
5.	Embeded Length of Pile (L_e)	=	23.00	m	> 4T
					12.79237763 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.90 kg/cm^3

T = 319.81 cm
= 3.198 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level
L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.199
= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;
Equivalent Cantilever Length L_f = 2.2 x 3.199
= **7.04** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{3 E I}$$

Fixed Head Piles

$$Y = \frac{Q (L_1 + L_f)^3}{12 E I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top; $$Q = \frac{12 EI Y}{(L_1 + L_f)^3}$$

= 51869.05 kg
= **52** t

Hence, the horizontal Load carrying capacity of the pile is taken as **52 ton for the design**

Name of Project:	Exploring alternate alignments, final location survey, geological mapping,geo-technical investigation, detail design of tunnel & its approaches including Viaduct if any and other ancillary work in Sohna-Manesar Section of HORC project.

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.
In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4)\times D^2\times L\times(2.5-1)$ gm

Frictional resistance = 611.86 T

W_p = 39.024 T

so Q_{tu} = 446.928 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

148.98 T

SAY 149.00 T

CALCULATION OF LOAD CARRYING CAPACITY OF PILE

Calculation of load carrying capacity of bored cast in-situ pile considering

Pier (BH NO-11A)

Dia = 1.2 m

Length = 25.00 m From Bottom of the Pile Cap

Vertical Load Carrying Capacity

As per IRC:78-2014 (Appendix-5) & IS : 2911 Part I / Sec 2 - 2010 (Appendix B)

Axial Capacity of Piles in Soil - Static Formula

Ultimate Load Carrying Capacity (Qu) of a Pile is given by :

Q_u = R_u + R_f

Where, R_u = Ultimate Base Resistance

R_f = Ultimate Shaft Resistance

The Ultimate Base Resistance of Pile is as follows:

R_u = $A_p N_c c_p + Ap\,(0.5\,D\gamma\,N_\gamma + P_D Nq)$

= X' + Y' where; X' = $A_p N_c c_p$ *For Cohesive Soil*

Y' = $A_p\,(0.5\,D\gamma\,N_\gamma + P_D N_q)$ *For Granular Soil*

The Ultimate Side Resistance of Pile due to friction is as follows:

R_f = $\Sigma^n_{i=1}\,\alpha_i\,c_i\,A_{si} + \Sigma\,K\,P_{Di}\,\tan\delta_i\,A_{si}$

= X + Y where; X = $\Sigma^n_{i=1}\alpha_i\,c_i\,A_{si}$ *For Cohesive Soil*

Y = $\Sigma^n_{i=1}\,K_i\,P_{Di}\,\tan\delta_i\,A_{si}$ *For Granular Soil*

Where; A_p = cross sectional area of pile tip, in m^2

N_c = bearing capacity factor, may be taken as " 9 "

c_p = average cohesion at pile tip, in kN/m^2

α_i = adhesion factor for the ith layer depending on the consistency of soil

c_i = average cohesion for the ith layer, in kN/m^2

A_p = cross sectional area of pile tip, in m^2

D = diameter of the pile shaft, in m

γ = effective unit weight of the soil at pile tip, in kN/m^2

P_D = effective overburden pressure at pile tip, in kN/m^2

$\Sigma^n_{i=1}$ = summation for layers 1 to n in which pile is installed and which contribute to positive skin friction.

N_γ & N_q = bearing capacity factors depending upon the angle of internal friction "ϕ" at pile tip.

K_i = coefficient of Earth pressure applicable for the ith layer.

P_{Di} = effective overburden pressure for the " i^{th} " layer, in kN/m^2

δ = angle of wall friction between pile and soil, in degrees (may be taken equal to ϕ).

A_{si} = surface area of pile shaft in the ith layer, in m^2

Presented below is in tabular form the various soil parameters as encountered through the Bore hole

Bore hole Location -11A

Hence, the vertical Load carrying capacity of the pile is taken as **356 ton in the design**

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1.	Pile Diameter	=	1.200	m	
2.	Concrete design mix strength	=	35	Mpa	(Assume)
3.	Modulus of elasticity of Concrete (E_c)	=	5000 x sqrt (35)		
		=	295804.0	kg / cm^2	
4.	Moment of Inertia (I)	=	$\Pi\ d^4 / 64$		
		=	0.10179	m^4	
		=	10178760.2	cm^4	
5.	Embeded Length of Pile (L_e)	=	27.00	m	> 4T 12.79237763 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.90 kg/cm^3

T = 319.81 cm
= 3.198 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.199
= 0.00

Therefore from the graph we read the corresponding value of " $\mathbf{L_f / T}$ ".

L_f / T = 2.20 for pile in sand

Hence;

Equivalent Cantilever Length L_f = 2.2 x 3.199
= **7.04** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{3\,E\,I}$$

Fixed Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{12\,E\,I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top; $Q = \dfrac{12\ EI\ Y}{(L_1 + L_f)^3}$

= 51869.05 kg
= **52** t

Hence, the horizontal Load carrying capacity of the pile is taken as **52 ton for the design**

ESTIMATION OF UP-LIFT CAPACITY

In the worst case of submergance the first part of the expression representing end bearing resistance is neglected, and in its place submerged weight of the pile is taken to add towards the ultimate capacity of pile.

In the instant case therefore the ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = (2/3) \text{ rd of frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4) \times D^2 \times L \times (2.5-1)$ gm

Frictional resistance = 791.17 T

W_p = 45.810 T

so Q_{tu} = 573.254 T

safe Up Lift capacity with a factor of safety of 3 = $Q_{tu}/3$

191.08 T

SAY 191.00 T

PILE LOAD CALCULATION BY FORMULA
(As per Method-1 of IRC: 78 - 2014)
Pier (BH No- 12)
Length of pile=12.00 m and Dia. = 1.2 m

Pile Dia (D)=		**1200** mm
Ksp = Empirical Co-efficient (0.3 to 1.2)		**0.3**
qc = Ave. Compressive strength of rock core =		**36.00** N/mm^2
		As per IRC-78 Appendix-5 (709.3.1)
d = Dia of socket =		1200.00 mm
l = length of socket as per IRC:78-2014		300.00 mm
d_f = Depth factor = 1 + 0.4 (length of socket / dia of socket) =		1.1
Ab = Cross-sectional area of pile at base =	0.785 x D^2 =	1130400.00 mm^2
As = Surface area of socket =	3.142 x d x l =	1131120.00 mm^2
C_{us} = Ultimate shear along the socket of normal rock = 0.225 X $(q_c)^{0.5}$		**1.35** N/mm^2
Re = Ultimate end bearing = Ksp.qc.df.Ab =		13429152
Raf = Ultimate side socket shear = As.Cus =		1527012

Qa = Ultimate load carrying capacity of pile = Re + R_{af} = Ksp.q_c.d_f.A_b + A_s.q_s = 14956164 Newton

Considering factor of safety as per Clause 709.3.2 of IRC:78-2014

Safe load carrying capacity of pile = Qs = Re/3 + Raf/6= Ksp.qc.df.Ab/3 + As.qs/6

Qs = 4730886 Newton

= 473.09 Ton

SAY = 473 Ton

Horizontal Load Carrying Capacity

As per IS : 2911 Part I / Sec 2 - 1979 (Appendix C)

1.	Pile Diameter	=	1.200	m	
2.	Concrete design mix strength	=	35	Mpa	(Assumed)
3.	Modulus of elasticity of Concrete (E_c)	=	5000 x sqrt (35)		
		=	295804.0	kg / cm^2	
4.	Moment of Inertia (I)	=	Π d^4 / 64		
		=	0.10179	m^4	
		=	10178760.2	cm^4	
5.	Embeded Length of Pile (L_e)	=	19.955	m	> 4T 14.39 m

The depth of fixity is determined from the codal provisions and the graph given there.

From Table we get n_h = 0.50 kg/cm^3 (Assumed)

T = 359.70 cm
= 3.597 m

Free Length of pile (L_1) = Pile cap bottom Level - Scour Level

L_1 = **0.000** m

Hence; L_1 / T = 0 / 3.598
= 0.00

Therefore from the graph we read the corresponding value of " **L_f / T** ".

L_f / T = 2.20

Hence;

Equivalent Cantilever Length L_f = 2.2 x 3.598
= **7.91** m

The pile head deflection is calculated by " **Y** "

Free Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{3\,E\,I}$$

Fixed Head Piles

$$Y = \frac{Q\,(L_1 + L_f)^3}{12\,E\,I}$$

In our case the piles are considered to be Fixed Head piles

Considering an allowable deflection of 0.5 cm (say) at Scour Level

Lateral Load at Pile top; $$Q = \frac{12\,EI\,Y}{(L_1 + L_f)^3}$$

= 36453.97 kg
= **36** t

Hence, the horizontal Load carrying capacity of the pile is taken as **36 ton for the design**

ESTIMATION OF UPLIFT LOAD CARRYING CAPACITY

Frictional Resistance

d = Dia of socket =		1200.00 mm	
l = length of pile from bottom of the pile cap		10.00 m	
l = length of socket as per IRC:78-2014		300.00 mm	As per IRC-78 clause 709.3.6.2
As = Surface area of socket =	3.142 x d x l =	1131120.00 mm^2	
qc = Ave. Compressive strength of rock core =		**36.00** N/mm^2	As per IRC-78 Appendix-5 (709.3.1)
C_{us} = Ultimate shear along the socket of normal rock =	$0.225 \times (q_c)^{0.5}$	**1.35** N/mm^2	
Raf = Ultimate side socket shear = As.Cus =		1527012 N	
		152.7012 T	
Factor of safety		3.5	
Safe Frictional resistsnce with factor of safety		43.63 T	

ultimate uplift capacity of pile (Q_{tu}) shall be given by

$$Q_{tu} = \text{frictional resistance} + W_p$$

where W_p = Submerged weight of pile = $(3.141/4)\times d^2 \times L \times (2.5-1)$ T

W_p = 26.51 T

Frictional resistance = 43.63 T

So Q_{tu} = 70.136 T

say 70 T

Hence, the uplift load carrying capacity of the pile is **70 ton for the design**

Before execution of the construction work initial load test on pile shall be conducted as per IS:2911(Part-4)

2	Submerged Density	γ'	0.001768	kg/cm^3	

Assumptions

1	Width of Foundation	B	800	cm
2	Depth of foundation below Ground level	D_f	400	cm
3	Length of Foundation	L	1000	cm
4	Shape of Base		Square	
5	***Effect of Water Table***	W'	0.500	Worst condition
6	Factor of Safety for	Sand	2.5	

Calculations

Submerged Density	γ'	0.001768	kg/cm^3
	ϕ	37.6	°
	$N\phi$	4.130	

Surcharge Intensity = q = γ' D 0.71 kg/cm^2

Bearing Capacity Factors for ϕ	37.6 °	Shape Factors		Depth Factors		Inclination Factors	
N_q	49.368	s_q	1.200	d_q	1.1020	i_q	1.0000
N_γ	79.948	s_γ	0.800	d_γ	1.1020	i_γ	1.0000

Ultimate Net Bearing Capacity q_d = $q\,(N_q - 1)\, s_q\, d_q\, i_q + ½\, B\gamma\, N_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$

= 0.707 x (49.368 - 1) x 1.200 x 1.102 x 1.000
+ ½ x 800.0 x 0.002 x 79.948 x 0.800 x 1.102 x 1.000 x 0.500
= 45.2338 + 24.92

Ultimate Net Bearing Capacity q_d = **70.1563** kg/cm^2

Net Safe Bearing Capacity (NSBC)= **281** **T/m^2**

CALCULATION OF SETTLEMENT OF FOUNDATION

AS PER IS:8009 (Part -I)-1976

PIER (BH NO-09) AT 3.0 M DEPTH

Depth of foundation (D) =	3.0	m	
Width of foundation (B) =	8.0	m	
Influence Zone to be extended up to	1.5 B.		
Depth of influence zone =	12.0	m depth below foundation level.	
Depth of end of influence zone from G.L	15.0	m	

a) Settlement due to cohesionless soil beneath foundation level

Cohesionless strata exist upto	6.0	m depth below foundation level	
Corrected N Value	15		
Settelment from Fig No.9 of IS: 8009-1976	24	mm	(For 10 T/m^2)
Effect of water table (W')	0.5		Insert fig of fig 9, IS:8009-1976
Corrected Settlement	48.00	mm	As per cl. No. 9.1.4 of IS 8009(P-1)-1976
Imposed load =	**NSBC =**	**13.00** t/m^2	
Settlement for imposed load (Sf) =	62.40	mm	

Due to the cohesionless soil settlement = S_1 = 62.40 mm

Contd...

(For footing at 3.0 m depth)

Settlement of the cohesive soil below the cohesionless soil at 9.0 m depth up to 15.0 m depth.

Depth of foundation (D)	3.00 m
Length of foundation (L)	10.00 m
Width of foundation (B)	8.00 m
Load intensity at FL (3.0m depth below existing G.L, NSBC)=	13.00 T/m^2
At the mid height of clay layer width of spread =	17.00 m
Depth of clay layer from G.L	9.00 m
Depth of clay strata from depth of consideration below FL to end of influence zone =	6.00 m

Calculation of settlement :

Compression Index (Cc) =	0.123
Initial void ratio (e_0) =	0.68
Thickness of layer =	6.00 m
Submerged density =	1.000 g/cc
Initial Pressure P_0 =	12.00 t/m^2
Width of footing =	8.00 m
Length of footing =	10.00 m
Area of footing =	80.00 m^2
Width of spread =	17.00 m
Length of spread =	19.00 m
Area of spread =	323.00 m^2
Pressure intensity (ΔP)=	3.22 t/m^2

As per clause 9.2.2 of IS : 8009 (Part-I) -1976

$$S_f = \frac{H_t}{(1+e_0)} \times C_c \left[\log_{10} (P_0 + \Delta P)/P_0 \right]$$

Sf_1 = 0.0453 m

45.3 mm

Due to clay layer resting on cohesion less soil, value of λ = 0.75 As per tabel-1 of IS:8009(Pt-1)

Consolidated settlement (Sc) = Sfd x λ = 34.01 mm (Say 34.00 mm)

Total settlemen in mm = S_1+S_c= 96.4 mm

Depth factor = 0.91 As per Fig No.12 of IS 8009(P-1)-1976

$S_{fd} = S_f$ x Depth factor = 87.72 mm

Rigidity factor = 0.8

Final settlement= (Sfd x Rigidity Factor) 70.2 mm (Say 70mm)

For 25 mm settlement safe bearing pressure = 5.0 T/m2

For 50 mm settlement safe bearing pressure = 9.0 T/m2

CALCULATION OF SETTLEMENT OF FOUNDATION

AS PER IS:8009 (Part -I)-1976

PIER (BH NO-09) AT 4.0 M DEPTH

Depth of foundation	(D) =	4.0	m

For 50 mm settlement safe bearing pressure = 2.0 T/m2

CALCULATION OF SETTLEMENT OF FOUNDATION

AS PER IS:8009 (Part -I)-1976

PIER(BH NO-11A) AT 4.0 M DEPTH

Depth of foundation	(D) =	4.0	m	
Legth of foundation	(L) =	10.0	m	
Width of foundation	(B) =	8.0	m	
Influence Zone to be extended up to		1.5 B.		
Depth of influence zone =		12.0	m depth below foundation level.	
Depth of end of influence zone below the ground Level		16.0	m	

a) Settlement due to cohesionless soil beneath foundation level

Cohesionless strata exist upto	2.0	m depth below foundation level	
Average submerged Density for sand layer	1.000	g/cc	
Corrected N Value	7.5		
Setteltment from Fig No.9 of IS: 8009-1976	150	mm	(For 10 T/m^2)
Effect of water table (W')	0.5		Insert fig of fig 9, IS:8009-1976
Corrected Settlement	300.00	mm	As per cl. No. 9.1.4 of IS 8009(P-1)-1976
Imposed load =	**NSBC =**	**16.00** t/m^2	
Settlement for imposed load (Sf) =	480.00	mm	

Due to the cohesionless soil settlement = S_1 = 480.00 mm

Contd…

(For footing at 4.0 m depth)

Settlement of the cohesive soil below the cohesionless soil at 6.0 m depth up to 16.0 m depth.

Depth of foundation (D)	4.00 m
Length of foundation (L)	10.00 m
Width of foundation (B)	8.00 m
Load intensity at FL (2.0 m depth below existing G.L, NSBC)=	16.00 T/m^2
At the mid height of clay layer width of spread =	14.50 m
Depth of clay layer from G.L	6.00 m
Thickness of clay layer	9.00 m

Calculation of settlement :

Compression Index (Cc) =	0.111
Initial void ratio (e_0) =	0.64
Thickness of layer =	9.00 m
Submerged density =	1.000 g/cc
Initial Pressure P_0 =	10.50 t/m^2
Width of footing =	8.00 m
Length of footing =	10.00 m
Area of footing =	80.00 m^2
Width of spread =	14.50 m
Length of spread =	16.50 m
Area of spread =	239.25 m^2
Pressure intensity (ΔP)=	5.35 t/m^2

As per clause 9.2.2 of IS : 8009 (Part-I) -1976

$$S_f = \frac{H_t}{(1+e_0)} \times C_c \left[\log_{10} (P_0 + \Delta P)/P_0 \right]$$

Sf_1 = 0.1089 m

108.9 mm

Due to clay layer resting on cohesion less soil, value of λ = 0.75 As per tabel-1 of IS:8009(Pt-1)

Consolidated settlement (Sc) = Sfd x λ = 81.71 mm (Say 82.00 mm)

Contd..

(For footing at 4.0 m depth)

Settlement of the cohesionless soil below the cohesive soil at 15.0 m depth up to 16.0 m depth.

Depth of foundation	4.0	m	
Average submerged Density for sand	1.000	g/cc	
Cohesionless strata exist upto	1.0	m below	considering depth of influence zone
Corrected average N Value	28		
Settelment from Fig No.9 of IS: 8009-1976	10.4	mm	(For 10 T/m^2)
Effect of water table (W')	0.5		Insert fig of fig 9, IS:8009-1976
Corrected Settlement	20.80	mm	As per cl. No. 9.1.4 of IS 8009(P-1)-1976

Imposed load = $\sigma_z = I_B P$ **= 0.148 X16=** **2.37** t/m^2

(Derived using Boussinesq chart (fig.18) of IS:8009(part-1))

Settlement for imposed load S_3 (Sf) =	5.00	mm	
For footing at 4.50 m depth total calculated settlement in mm =			567.00
Depth factor =	0.87		As per Fig No.12 of IS 8009(P-1)-1976
$S_{fd} = S_f$ x Depth factor =	493.29	mm	
Rigidity factor =	0.8		
Final settlement (S) in mm=	395	mm	
For 25 mm settlement safe bearing pressure =	1.0	t/m^2	
For 50 mm settlement safe bearing pressure =	2.0	t/m^2	

SETTLEMENT ANALYSIS

PIER (BH No-12) at 2.0 m depth

AS PER IS:8009 (Part -I)-1976

Depth of foundation	2.0	m	
Corrected N Value	30		
Settelment from Fig No.9 of IS: 8009-1976	10	mm	(For 10 T/m^2)
Effect of water table (W')	0.5		Insert fig of fig 9, IS:8009-1976
Corrected Settlement	20.00	mm	As per cl. No. 9.1.4 of IS 8009(P-1)-1976
Imposed load =	**NSBC =**	**79.00** t/m^2	
Settlement for imposed load (Sf) =	158.00	mm	
Depth factor =	0.95		As per IS 8009(P-1)-1976 of fig.12
$S_{fd} = S_f$ x Depth factor =	150.10	mm	
Rigidity factor =	0.8		
Final settlement (S) = (Sfd x Rigidity Factor)	120.1	mm	
say	120	mm	

For 25mm settlement safe bearing pressure = 16.00 t/m^2

For 50mm settlement safe bearing pressure = 33.00 t/m^2

SETTLEMENT ANALYSIS

PIER (BH No-12) at 3.0 m depth

AS PER IS:8009 (Part -I)-1976

Depth of foundation	3.0	m	
Corrected N Value	37		
Settelment from Fig No.9 of IS: 8009-1976	7.8	mm	(For 10 T/m^2)
Effect of water table (W')	0.5		Insert fig of fig 9, IS:8009-1976
Corrected Settlement	15.60	mm	As per cl. No. 9.1.4 of IS 8009(P-1)-1976
Imposed load =	**NSBC =**	**230.00** t/m^2	
Settlement for imposed load (Sf) =	358.80	mm	
Depth factor =	0.91		As per IS 8009(P-1)-1976 of fig.12
$S_{fd} = S_f$ x Depth factor =	326.51	mm	
Rigidity factor =	0.8		
Final settlement (S) = (Sfd x Rigidity Factor)	261.2	mm	
say	261	mm	

For 25mm settlement safe bearing pressure = 22.00 t/m^2

For 75mm settlement safe bearing pressure = 44.00 t/m^2

SETTLEMENT ANALYSIS

PIER (BH No-12) at 4.0 m depth

AS PER IS:8009 (Part -I)-1976

Depth of foundation	4.0	m	
Corrected N Value	37		
Settelment from Fig No.9 of IS: 8009-1976	7.8	mm	(For 10 T/m^2)
Effect of water table (W')	0.5		Insert fig of fig 9, IS:8009-1976
Corrected Settlement	15.60	mm	As per cl. No. 9.1.4 of IS 8009(P-1)-1976
Imposed load =	**NSBC =**	**281.00** t/m^2	
Settlement for imposed load (Sf) =	438.36	mm	
Depth factor =	0.87		As per IS 8009(P-1)-1976 of fig.12
$S_{fd} = S_f$ x Depth factor =	381.37	mm	
Rigidity factor =	0.8		
Final settlement (S) = (Sfd x Rigidity Factor)	305.1	mm	
say	305	mm	

For 25mm settlement safe bearing pressure = 23.00 t/m^2

For 75mm settlement safe bearing pressure = 46.00 t/m^2

ANNEXURE -F
LIQUEFACTION CALCULATION

Liquefaction Analysis Using SPT Data

Since the value of (N1)60cs is graeter than equal to 30, so the soil are too densed to liquefy and are classed as nonliquefiable.

Name of Project:	Exploring alternate alignments, final location survey, geological mapping,geo-technical investigation, detail design of tunnel & its approaches including Viaduct if any and other ancillary work in Sohna-Manesar Section of HORC project.

10		40.0		SM	>50	50	1.000	4.000	0.54	26.91	21

Note: Above Strength parameters (C& ϕ) are calculated theoritically from N value.

1. As per Terzaghi & Peck, in case of cohesive soil there is a relationship between N value & consistency.
   Where N is the corrected N value.
2. In case of cohesionless, for angle of shearing resistance (ϕ), fig - 1 of IS : 6403 was used.
3. In case of clay soil, if N>30 then it may be considered limited to 30.
4. Overburden correction factor is considered as1 whereever its value is greater than 1.

Subject :- Geotechnical investigation work for Haryana Orbital Rail Corridor (HORC) project from Palwal to Harsana Kalan in the state of Haryana.

Dear Sir,

We are pleased to submit this report of the subject work based on 08 boreholes carried out at Connecting Line from Prithala to New Prithla [Old Ch. (-)2+514 to Old Ch. (-)0+934 {New Ch. (-)1+838 to (-)0+248}] for the proposed project site.

The accompanying report presents results of various field tests and laboratory tests conducted on selected soil samples and their interpretation.

Should there be any clarifications regarding the contents please contact us at your most convenient time.

We value the opportunity to participate in this project and look forward a pleasant association on future projects.

Very truly yours,
CEG Test House & Research Centre Pvt. Ltd.

CHAPTER 1 GENERAL

1.0 INTRODUCTION:

The work of conducting "**Conducting geotechnical investigation, preparation of geotechnical report for designing of bridges and for embankment in connection with construction of Haryana Orbital Rail Corridor (HORC) project from Palwal to Harsana Kalan including connectivity to existing IR network in the state of Haryana"** was awarded to "**CEG Test House & Research Centre Pvt. Ltd., Jaipur" by M/S.** "**Haryana Rail Infrastructure Development Corporation Ltd. (HRIDCL)"** as per work order no. HRIDC/ HORC/ GT/ CEG/ 237/ 2021/ 577-M dated 29th July 2021.

Field work including drilling of boreholes, conducting field tests such as Electrical Resistivity Test, & Plate Load Test and sample collection was carried out in the presence of representative of Client. Laboratory tests were conducted on selected soil samples to determine the design parameters, confirming to relevant IS specifications and the guidelines received from time to time from representative of Client.

This report includes the details of Methodology of Investigation, collection of samples of soil, field test results, laboratory test results, analysis of results and recommendations for proposed structure carried out at Connecting Line from Prithala to New Prithla [Old Ch. (-)2+514 to Old Ch. (-)0+934 {New Ch (-)1+838 to (-)0+248}] based on soil sample collected from the locations of 08 boreholes.

2.0 SITE LOCATION & GENERAL GEOLOGICAL HISTORY:

The details of the site & test locations for the proposed project are shown in location plan attached vide **Appendix A-1**. The site of proposed project is located from Palwal to Harsana Kalan (Sonipat) in the State of Haryana falls in seismic zone – IV (Zone factor=0.24) of India.

Soil of the Haryana Sub-Region have been classified and described under the following major soil types as shown below:-

- Typic Ustochrepts : Soil of old alluvial plains
- Typic Ustipsamments : Soil of Aravali plains
- Typic Ustifluvents : Soil of recent alluvial plains and flood plains
- Typic Torripsamments : Soil of Aeofluvial plains
- Rocky Outcrops : Aravali rocky hills

The district wise details of soil characteristics are described below:-

Panipat: The soils are well drained, Sandy loam to clay loam/silty clay loam in plains and loam to clay loam/ silty/ loose clay loam in relic channels/depressions/basins.

Sonipat: The district comprises of recent flood plains, young meander plains, old meander plains and old alluvial plains. Recent flood plains occur along the Yamuna River and clearly show fluvial features. The soils are loamy sand to sandy loam on the surface and sandy loam to clay loam in the sub surface.

Rohtak: The district mainly comprises of old alluvial plains. The soils are loamy sand to sandy loam on the surface and sandy loam to clay loam in the sub surface. Old meander plains are almost flat with loamy sand to silty clay loam soils. Oldest among all the land forms are old alluvial plains, which cover major areas in the district. These soils are sand to loamy sand/sandy loam (surface) to silt loam/silty clay loam (sub-surface).

Jhajjar: The district mainly comprises of old alluvial plains and some parts of the district also have soil belonging to Aravali plains.

Rewari: The soils of the district fall under Entisols and Inceptisols orders. The surface soil texture varies from sand to fine loamy sand.

Gurgaon: The district comprises of sand dunes, sandy plains, alluvial plains, salt affected areas,

low lands, lakes, hills and pediments. The soil varies from sand to loamy sand in sand dunes and sandy plain areas, sandy loam to clay loam / silty clay loam in alluvial plains, calcareous, loamy sand to loam in salt affected plains, silty loam to loam in low lands and calcareous, loamy sand to loam in hills.

Mewat: The soils of the area are generally sandy loam to loam. In parts of the low-lying areas, they are clayey and saline. The upper hills are mostly barren.

Faridabad and Palwal: The district comprises of recent Yamuna flood plains, low lying plains, depressions, sand dunes and hills. The texture of the soil is sand to loamy sand in recent Yamuna flood plains, sandy loam in plains, sandy loam to clay loam in alluvial plains, sandy loam to loam

(surface), clay loam/silty clay (sub-surface) in low lying plains and depressions.

3.0 SCOPE OF WORK:

The stipulated scope of work involved carrying out the following operations:-

a) Mobilisation of necessary plant equipment, men and materials for the complete Geotechnical investigation work as per specifications, drawings and instructions of the Engineer and to complete the same within the stipulated time schedule and demobilisation after completion of field work.

b) Shifting of Equipments from one structure location to another including Ereaction, installation of rigs at site and dismantling of the same after completion of field work. Shifting of setup for each borehole location and associated preparation for borehole under water

c) Making 150 mm nominal diameter boreholes at various locations in all types of soils except hard rock and large boulders using suitable approved method of boring including chiselling, cleaning, providing casing pipe as required; performing Standard Penetration Test at every 3.0m interval and at change of strata; collection of water samples and disturbed soil samples, observation such as ground water, etc., collection of undisturbed soil samples at every 3.0 m interval and at change of strata; transportation of all the collected samples to the laboratory and back filling of boreholes on completion of the same, complete as per specification and instructions of the Engineer, for depths below natural ground level.

d) Conducting Electrical resistivity tests at various locations all complete as per specification and directions of the Engineer.

e) Conducting plate load test at various locations, all complete as per specification and directions of the Engineer.

f) Drilling of Nx size boreholes (75mm dia.) in all types of hard rock, collection of core samples, maintaining continuous record of core recovery/ RQD, keeping the cores in wooden core boxes, transporting to laboratory, backfilling on completion of the same, all complete as per specification and instructions of the EIC.

g) Conducting various laboratory tests on soil samples at an approved laboratory including preparation of soil samples to determine the following properties of soil, all complete as per specification.

On soil Samples

- Dry density test
- Bulk Density and Moisture Content.
- Sieve Analysis
- Hydrometer Analysis
- Liquid Limit and Plastic Limit
- Specific gravity
- Shrinkage Limit
- Free Swell Index
- Direct Shear Test
- Triaxial Shear Test
- One Dimensional consolidation test
- Chemical Analysis of soil samples (pH, chloride, Sulphate)

h) Conducting laboratory tests on rock samples including preparation of the samples to determine the following properties, all complete as per specification

On Rock Samples

- Moisture content, porosity & Density
- Specific gravity
- Hardness
- Unconfined compression test
- Point load strength index
- Modulus of Elasticity and Poission's Ratio
- Abrasion Test

i) Conducting chemical tests on water samples to determine the Sulphate, chloride and pH value all complete as per specification.

j) Submitting draft report in soft copy including all field records and laboratory test results, graphs, etc., all complete as per specifications.

k) Submitting final report in three hard copies in after the approval of the draft report including all field records and laboratory test results, graphs, etc., all complete as per specifications.

4.0 FIELD INVESTIGATION IN SOIL STRATA:

The investigation was planned to obtain the subsurface stratification in the proposed project site and collect soil / rock core samples for laboratory testing to determine the engineering properties such as shear strength, along with basic engineering classification of the subsurface stratum.

For geotechnical investigation work, required equipements along with rotary drilling rigs and manpower were mobilized at site to carry out various field activities as per the scope of work. These were shifted from one test location to another location during execution of field work and were demobilized on satisfactory completion of field work.

For conducting the field investigations the following practices were followed at site:

- The locations of 08 boreholes carried out at Connecting Line from Prithala to New Prithla **[**Old Ch. (-)2+514 to Old Ch. (-)0+934 {New Ch. (-)1+838 to (-)0+248}] were marked at site at specified locations. These locations are shown in **Appendix-A1** attached subsequently.

The details of various boreholes along with their coordinates are provided herein below:

Table 1.1: Details of Borehole Locations

***NE=Not Encountered**

- In soil, boreholes of 150mm dia. were drilled as per the standard procedure laid in IS: 1892.
- Borehole was properly cleaned before taking any sample in soil.
- Casing was used as per the prevailing soil conditions, to stabilize the borehole.
- Standard Penetration Tests were conducted in bore holes at regular intervals or at every change of strata as per Technical specification.
- Undisturbed were collected wherevery feasible as per the requirements and at specified depths. The same has been discussed in detail in soil characteristics sheets attached with the report.
- The Ground Water Table was met at depths of from 5.10m to 8.10m below EGL. The detailed procedure adopted for conducting various field tests is given here in below:

(i) Standard Penetration Test:

The Standard Penetration Test was conducted in boreholes as per IS 2131. The test was carried out using the standard split spoon sampler to measure the number of blows 'N'.

Standard split spoon sampler was attached to an 'A' rod. It was driven from borehole bottom to a distance of 45 cm using a standard hammer of 63.5 kg falling freely from a height of 75 cm to the required depth. While driving, the number of blows required to penetrate every 15 cm are recorded. The total number of blows required for the last 30 cm is taken as 'N' value at that particular depth of the borehole. Wherever the total penetration was less than 45cm, the no. of blows & the depth penetrated is recorded in the respective borelog.

SPT 'N' values were correlated with relative density of non-cohesive stratum and with consistency of cohesive stratum as given below:-

Table 1.2: Soil compactness as per SPT N values (cl. 9.7, table 9.3 & 9.4, page 330_text book of V.N.S. Murthy)

Correlation for Clay / Plastic silt		Correlation for Sand / Non-Plastic silt	
Consistency	**SPT "N" Value**	**Compactness**	**SPT "N" Value**
Very Soft	0 - 2	Very Loose	0 - 4
Soft	2 - 4	Loose	4 - 10
Medium	4 - 8	Medium	10 - 30
Stiff	8 - 15	Dense	30 - 50
Very Stiff	15 - 30	Very Dense	> 50
Hard	> 30		

The field SPT N values obtained were further corrected as per the guidelines given in IS: 2131 as follows:

(a) For overburden: - The N value for cohesionless soil is corrected with the help of fig. 1 given in IS-2131.

(b) Due to dilatancy :- Wherever N values observed below water table in fine sand, silty sand or silt was greater than 15, then corrected N values were corrected as under:

$$N' = 15 + \frac{1}{2}(N-15)$$

(ii) Undisturbed Sampling (Soil) in boreholes:

Undisturbed samples were collected using MS tubes of suitable diameter and length with Area ratio as per clause 4.1.1 (c) of IS: 1892 (latest) fitted to an adopter with ball and socket arrangement. Before taking any sample, sampling tube was properly greased. Immediately after taking on undisturbed sample in a tube, the adopter head was removed along with the disturbed material. The visible ends of the sample were trimmed off any wet disturbed soil. The ends were coated alternately with four layers of just molten wax. More molten wax was added to give a total thickness of min. 25 mm. The samples were carefully labeled and transported to the laboratory for testing. Undisturbed samples wherever slipped during lifting were duly marked in the field logs as well as in the soil profile.

5.0 LABORATORY TESTS ON SOIL SAMPLES:

The following laboratory tests were conducted on selected soil samples:

Table 1.3: Description of Tests

Description of Test	Reference	Undisturbed (UDS) Soil Samples	Disturbed (DS/SPT) Soil Samples
Grain Size Analysis / Hydrometer	IS: 2720 (Part - 4)	√	-

Description of Test	Reference	Undisturbed (UDS) Soil Samples	Disturbed (DS/SPT) Soil Samples
Natural Moisture Content / Bulk / Dry density	IS : 2720 (Part – 2)	√	-
Atterberg Limits • Liquid Limit • Plastic Limit	 IS: 2720 (Part - 5) IS: 2720 (Part - 5)	 √ √	 √ √
Specific Gravity	IS : 2720 (Part – 3)	√	-
Direct Shear Test	IS : 2720 (Part – 13)	√	-
Triaxial compressive shear test	IS : 2720 (Part – 11 & 12)	√	-
Chemical Analysis of Soil Samples	IS : 2720 (Part – 26, 27)	√	-

Note:- The detailed procedure adopted for conducting various laboratory tests is described in the following paragraphs:

5.1.1 Dry density and Bulk density

For determination of bulk density and dry density, a sample of known volume 'V' was extracted from the undisturbed sampling tube and it's bulk weight 'W' was noted down.Moisture content 'Wn' was determined by oven drying method.

The bulk density and dry density were determined by following equation-

Bulk density (γ_b) = W/V

Dry density (γ_d) = γ_b/ (1+Wn)

5.1.2 Natural water content

For this test, the soil sample of known quantity (Wm) was taken in a container.The container with soil sample was placed into an oven for drying at 105-110°c temperature for 16-24 hours. After drying, the dry sample was again weighted to determine the dry weight of sample (Wd).

The natural water content was computed by the following equation-

Wn = (Wm-Wd)*100/Wd

5.1.3 Grain Size Analysis (IS: 2720- Part-4)

Wet sieve analysis:

For determination of particle sizes finer than 75 micron, wet sieve analysis test was conducted. For this test, oven dried sample of known quantity was taken in a container and soaked with dispersing agent. The soaked soil sample was washed thoroughly over 75 micron IS sieve until the water passing sieve was substantially clean.

Fraction retained on 75 micron IS sieve was carefully collected in a container without any loss in material and placed into oven for drying.

Dry sieve analysis:

For this test, the oven dried soil sample after wet sieving was sieved through the set of IS sieves 20 mm, 10 mm, 4.75 mm, 2.0 mm, 1.0 m , 425 micron , 300 micron, 150 micron and 75micron. The amounts of soil retained on each sieve were noted down. The % retained, cumulative % retained and % passing were computed accordingly. Wherever the soil sample % passing 75 micron sieve was significant, Hydrometer method was used to find the percentage of silt and clay fraction.

Grain size analysis for the fraction passing 75 micron IS Sieve (Hydrometer method)

Calibration of Hydrometer

Hydrometer was calibrated to determine a relationship (an equation) between the effective depth H_R and corresponding hydrometer reading R_h (obtained during test).

50 to 100 gm of soil sample passing through 75 micron IS Sieve was taken. It was mixed with 100 ml of sodium hexametaphesphate solution and the mixture was warmed for about 10 minutes. It was then transferred to the cup of the mechanical mixer and the soil suspension was stirred for 15 minutes. The soil suspension was transferred into 1000 ml measuring cylinder and distilled water was added to make 1000ml solution. This solution was mixed vigorously. The measuring cylinder was then allowed to stand and the stopwatch was started. Hydrometer was immersed in the solution and reading were taken after half, one, two and four minutes. The hydrometer was then removed slowly and kept in distilled water at the same temperature as the soil suspension. Readings were taken after the periods of 8, 15 and 30 minutes, and one, two and four hours. Hydrometer was removed, rinsed and placed in the distilled water after each reading. After 4 hours reading was taken once or twice within 24 hours. Finally a reading was taken at the end of 24 hours. The temperature of the suspension was observed and recorded.

Calculations

Diameter of the particles (D):

$$D = \sqrt{\frac{30\mu}{980(G-1)}} \times \sqrt{\frac{H_R}{t}} = M\sqrt{\frac{H_R}{t}}$$

Where,

D = diameter of particle in suspension, in mm;

μ = co-efficient of viscosity of water at the temperature of the suspension at the time of taking the hydrometer reading, in poise;

G = specific gravity of the soil fraction used in the sedimentations analysis;

H_R = effective depth corresponding to R_n, in cm.

t = time elapsed between the beginning of sedimentation and taking of hydrometer reading in minutes

$M = \sqrt{\frac{30\mu}{980(G-1)}}$ = a constant factor for given values of μ and G at the temperature of the suspension.

Percentage finer than diameter D:

The percentage by mass (w) of particles smaller than corresponding equivalent particle diameters (D) was calculated from the formula:

$$w = \frac{100G_s}{W_b(G_s - 1)} \times R_h$$

Where

w = percentage finer

G_s = specific gravity of soil particle

W_b = weight of soil

R_h = Hydrometer reading

5.1.4 Specific Gravity (IS: 2720-Part-3 Sec-1)

The specific gravity of soil sample was determined by density bottle method. For this test 5-10g oven dried and cooled soil sample was taken in 50ml capacity density bottle and its weight was noted down as W_2 .The soil was covered with distilled water and left for sufficient period for suitable soaking. The entrapped air was removed by vacuum. The bottle with soil was filled fully with water and its weight was noted down (W_3). The mass of empty bottle and bottle filled with distilled water were noted down as W_1 and W_4 respectively.

The Specific Gravity was determined by using following equation :

$G=W_2-W_1/[(W_2-W_1)-(W_3-W_4)]$

5.1.5 Liquid Limit (IS: 2720- Part-5)

By Cone Penetrometer Method

The 'Cone Penetrometer Apparatus' is a variant of the fall-cone and consists of a cone with a smooth polished surface and angle of 30° ± 1/2°. The weight of the cone, together with its associated shaft is 80g ± 0.5g. A support assembly with an automatic cone release mechanism and cone height adjustment mechanism used to hold the cone vertically. The angle and weight of the cone were calibrated at regular intervals, and the sharpness of the cone tip was checked daily.

Distilled water was added and thoroughly mixed with the soil sample to produce a homogeneous paste. The paste was then placed in a cup with a diameter of at least 55mm and a depth of at least 40mm. The surface of the soil was smoothed off level and parallel to the base. The support assembly was used to position the tip of the cone so that it was just touching the top surface of the soil, and the automatic tripping mechanism was released. The cone was allowed to penetrate into the soil for a period of 5 (± 1) s, then the cone was locked off to stop further movement and the penetration was recorded. The cup was refilled and the test was repeated. The two recorded penetrations need to be within 0.5mm of each other, otherwise a third test is performed. when the three test vary by more than 1mm the test was repeated.

Further tests were conducted, at varying water contents, in order to produce a series of cone penetrations (usually 4) in the range 15mm to 25mm. The resulting cone penetrations were plotted verses the water content of the test specimens. The Liquid Limit (W_L) was read off the graph, being the water content at which the line of best fit through the test points crosses 20mm penetration.

5.1.6 Plastic Limit (IS: 2720-Part-5)

For this test, soil sample was prepared in the same way as for liquid limit test. A ball of soil sample weighed about 5 gm was formed. The ball was rolled between the fingers of one hand and the glass plate with pressure sufficient to reduce the mass into a thread of about 3 mm in 5 to 10 complete forward and back movements. When a diameter of 3 mm was reached, soil was again remolded into a ball. The process of rolling and remolding was repeated until the thread started just crumbing at a diameter of 3 mm. The crumbled thread was immediately transferred to an airtight container for determination of its moisture content by oven drying method.

This water content has been termed as plastic limit. (W_P)

5.1.7 Plasticity Index (IS: 2720-Part-5)

The plasticity index Ip was given by

$I_p=W_L-W_P$ (in percent)

5.1.8 Direct Shear Test (IS:2720-Part-13):

For this test shear box test apparatus was used. The prepared specimen from remolded/undisturbed sample was placed carefully in the box. The plain grid was kept on top of the specimen with its directions at right angles to the direction of shear. The upper porous stone was placed on the grid and loading pad on the stone. The box with specimen was gently placed in the container (water jacket). The specimen was submerged with water. The container was mounted with the shear box and the specimen inside, on the shearing machine. The upper part of the box was so adjusted that it touchéd the proving ring. The jack was brought forward to bear up against the box container. The proving ring dial gauge was set to read zero.

The steel ball was placed in the recess of the loading pad. The loading yoke was set in contact with the steel ball on the loading pad. Vertical displacement dial gauge to read zero in contact with the top of the yoke. The normal load was applied and any change in thickness of specimen was recorded. Shear displacement dial gauge was also set to read zero. The locking screw was now removed and two parts of the shear box were separated by advancing the spacing screws.

The specimen was sheared at constant rate of strain. The readings of the proving ring dial gauge were noted down every 15 seconds for the first one-minute and then every 30 seconds thereafter. The reading of change in the thickness dial gauge and shear displacement dial gauge were also recorded at the same time interval. The test was continued until the specimen fails. The specimen was assumed to fail when the proving ring dial gauge started receding or at shear displacement of approximately 15% of the length took place.

The soil was removed from the box and test was repeated on the identical specimen under increased normal load.

The rate of strain for conducting Direct Shear Test is kept as 0.25 mm/min as per codal/literature provision based on strata.

5.1.9 Triaxial Shear Test_UUT (IS: 2720-Part-11)

For this test, Triaxial Shear Test apparatus was used. The plain disc was placed on the pedestal of the triaxial cell. The specimen was placed centrally on the disc. A correct size rubber membrane was fitted inside the stretcher with ends of membrane folded over those of the stretcher. Vacuum was applied to stretch the membrane to the inside surface of the stretcher which was carefully slipped around the specimen kept on the pedestal. The vacuum on the membrane was released. Its bottom part was rolled down into the pedestal. plain disc was placed on the top of the specimen and then loading pad was placed. The top part of membrane was rolled on to the loading pad. Then the stretcher was removed and ends were sealed with ‘O’ rings. With the properly sealed specimen placed centrally on the pedestal, the cell was assembled, keeping the loading piston initially clear of the loading pad of the specimen, the assembly was placed in the loading frame.

For unconsolidated undrained test, the bottom drainage value (BDV) and top drainage value (TDV) of cell, was closed and air release valve (ARV) was opened. The cell was filled with water through the cell water value CWV. ARV was closed when water begins to escape through it. The cell pressure was raised to the desired value and kept constant till the end of the test.

When the cell pressure was applied, the load piston rises upward, the loading machine was operated at the anticipated rate to bring the load piston slightly above the loading pad of the specimen and the load measuring dial gauge on proving ring was set to zero.

The piston was brought just in contact with loading pad by hand operation of the machine. The axial compression dial gauge was mounted and set to read zero.

The axial loading was started at 1.25 mm/min rate of strain. Simultaneous readings on the load and compression dial gauges were noted down. The test was continued until a recession of the axial load is observed or 20% of strain.

After failure, the specimen was unloaded by reversing the loading machine, cell pressure was reduced and cell water was drained out through BRV. The cell was dismantled and the specimen was taken out, rubber membrane was removed and weight of the failed sample and its water content was determined. The test was repeated on two more identical specimens with increasing cell pressure.

The rate of strain for conducting UUT is kept as 1.25 mm/min as per codal/literature provision based on strata.

5.1.10 Chemical Testing

Chemical Testing was generally performed in accordance with IS: 2720, but the different parts of method as described below:

a) **Total Sulphate Content Of Soil**

Samples were tested according to IS 2720 (Part 27). The dried soil was extracted with a 10% solution of hydrochloric acid. The extract was adjusted to slightly alkaline pH with ammonia, and then barium chloride solution was added to precipitate the sulphate. The barium sulphate precipitate was collected by filtration, and it was washed, dried and weighed. The mass of barium sulphate recovered was used to calculate the sulphate content of the original soil.

b) **pH Value**

Samples were tested according to IS: 2720 (Part 26). The soil sample (30 ± 0.1g) was extracted with 75 ml of distilled water and the pH of the resulting suspension was measured with a calibrated (by means of Standard buffer solution) pH meter.

c) **Chloride Content**

For the water soluble content, soil samples were extracted with a volume of water equal to twice the mass of the soil. The extract was filtered and acidified with a small amount of nitric acid. Standardized silver nitrate solution was then added to precipitate the chloride as its silver salt. The amount of precipitated silver remaining in solution was then determined by titration.

An acid-soluble version of the test was also available, with the initial extraction being with nitric acid instead of water.

CHAPTER 2 ANALYSIS OF TEST RESULTS AND INTERPRETATION

6.0 STRATIFICATION

From the study of the borehole carried out at Connecting Line from Prithala to New Prithla **[**Old Ch. (-)2+514 to Old Ch. (-)0+934 **{**New Ch (-)1+838 to (-)0+248}], it is revealed that the substrata of all boreholes mainly consisit of Silty Clay of low plasticity (CL), sandy silt of low plasticity (ML-CL), Silty Sand with Clay (SM-SC), Silty Sand (SM).

6.1 GROUND WATER TABLE DEPTH

The Ground Water Table was met at depths of from 5.10m to 8.10m below EGL as given in Table 1.1, it may rise up during heavy rains / rainy season. Therefore, for the analysis of various foundations, the water table has been considered to rise by about 2 to 3.0m at the locations of boreholes.

6.2 RESULTS OF CHEMICAL ANALYSIS

Results of chemical analysis of soil samples (as per **Appendix – B2**) indicates that the soil sample falls under Class I for sulphates and chlorides concentration (As per IS 456-2000 and CIRIA Sp. Publication No. 31). The results are summarized here in below :-

Summary of chemical analysis of soil samples

Chemical Property	Findings (Min. to Max.)	Remarks (Required limits as per IS 456-2000)
pH	6.95 to 8.17	> 6.0
Sulphite as SO_3^{2-} (%)	0.0021 (%) to 0.0029 (%)	< 0.2% (Class I)
Chlorides as Cl^- (%)	0.0062 (%) to 0.0088 (%)	No limit specified in IS 456. However, a limit of 0.10% specified for class I in CIRIA Sp. Publication No. 31)

Note :- All the chemical contents are within permissible limit hence no special precautions are required.

6.3 COMPUTATION OF LIQUEFACTION POTENTIAL

Liquefaction is the sudden loss of shear strength of the sub soil strata due to earthquake-induced vibration under saturated conditions.

Assessment of liquefaction potential of foundation strata is made by simplified approach proposed as per IS: 1893 (Part-1)-2016, from the SPT data and peak ground acceleration likely to occur at the site. In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake (DBE) is first evaluated.

Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Unsaturated soils are not subjected to liquefaction because vibratory forces from earthquakes do not cause any increase in pore water pressure in such soils.

The area of site from Palwal to Harsana Kalan (Sonipat) in the State of Haryana falls in seismic zone – IV of India as per IS: 1893. Further as per the provisions of IS: 1893 in soil deposits consisting of submerged loose sands & soils falling under classification of SP with standard penetration N value less than 15, the shaking caused by earthquake ground motion may cause liquefaction or excessive total and differential settlements.

For the analysis of liquefaction potential, following constant parameters are considered:

EQ Zone	IV
Earthquake Magnitude (Mw)	7.0
Peak Horizontal Ground Acceleration (amax /g)	0.24

The Ground Water Table was met at depths of from 5.10m to 8.10m below EGL as given in Table 1.1. For the analysis of liquefaction potential, the water table is generally considered to rise by about 2.0m to 3.0m at the location of all boreholes. The strata in the boreholes are not likely to liquefy as mentioned above and the same is tabulated below:-

Table 2.1: Liquefaction Analysis

S. No.	Chainage Old (km)	Chainage New (km)	Structure	BH.No.	Depth of Water Table below EGL (m)	Water table depth Considered for Liquefaction Analysis	Liquefiable Depth (m)
1.	(-)2+514	(-)1+838	MNB	BH-CL	7.15	3.15	Non Liquefiable
2.	(-)1+969	(-)1+291	MNB	BH-CL	7.50	4.50	Non Liquefiable
3.	(-)1+500	(-)0+821	MJB	BH-A1	5.10	2.00	Non Liquefiable
4.			MJB	BH-A2	5.20	2.00	Non Liquefiable
5.	(-)1+269	(-)0+592	MJB	BH-A1	6.10	3.00	Non Liquefiable
6.			MJB	BH-A2	6.55	3.00	Non Liquefiable
7.	(-)1+241	(-)0+567	MNB	BH-CL	6.50	3.00	Non Liquefiable
8.	(-)0+934	(-)0+248	MNB	BH-CL	8.10	5.10	Non Liquefiable

6.4 INTERPRETATION OF LAB TEST RESULTS

Grain Size Analysis

1. **Clay content:** It generally varies from 4 to 11%.
2. **Silt content:** It generally varies from 20 to 66%.
3. **Sand content:** It generally varies from 22 to 85%.
4. **Gravel content:** It generally varies from 1 to 10%.

Atterberg's Limit

5. **Liquid limit:** The test results of liquid limit of the soil samples reveal that it generally varies from 24 to 28% in ML-CL type of soil, 32 to 33% in CL type of soil.
6. **Plastic Limit:** The plastic limit of the soil sample varies from 20 to 21% in ML-CL type of soil, 20 to 23% in CL type of soil. However ML-CL type of soil is considered as non-plastic.
7. **Plasticity index:** The plasticity index of the soil samples generally varies from 5 to 6% in ML-CL type of soil, 9 to 11% in CL type of soil whereas ML-CL and SM/ SM-SC/ SC type of soil are non-plastic.

Natural moisture content & Bulk density

The bulk density of soil samples generally varies from 1.84 gm/cc to 1.97gm/cc whereas natural moisture content varies from 10% to 21%.

Direct shear tests:

Direct shear test under drained condition have been conducted in sandy silty (ML-CL) / sandy stratum (SM/ SM-SC/ SC) type of soil.

For Sandy strata (SM/ SM-SC/ SC), the value of angle of internal friction varies from 28^o to 32^o, whereas cohesion varies from 0.00 kg/cm^2 to 0.11 kg/cm^2.

For Silty strata (ML-CL), the value of angle of internal friction varies from 24^o to 27^o, whereas cohesion varies from 0.11 kg/cm^2 to 0.22 kg/cm^2.

Triaxial shear tests:

Triaxial shear test under undrained condition have been conducted in silty clay (CL) type of soil.

For silty clay (CL) strata, the value of angle of internal friction varies from 4^o to 5^o, whereas cohesion varies from 1.41kg/cm^2 to 2.22 kg/cm^2.

CHAPTER 3 TYPE AND DEPTH OF FOUNDATION WITH ANALYSIS

7.0 TYPE & DEPTH OF FOUNDATION:

Based on the nature & strength characteristics of the substrata and requirement of the project, the following type of foundation have been analyzed as given below:

Table 3.1 : Shallow Foundation

Type of foundation	Depth of Foundation below E.G.L. (m)	Size of Foundation (m x m)
Shallow Foundation	1.0, 2.0, 3.0	4.8 x 4.8
	2.0, 3.0, 4.0	7.2 x 7.2
	1.0, 1.5, 2.0	8.0 x 8.0

Table 3.2 : Pile Foundation

Type of foundation	Length of Pile below E.G.L. (m)	Dia. of Pile (m)
Normal Bored Cast in-situ RCC Pile	20.0, 22.0, 24.0, 26.0, 28.0 & 30.0	1.0 & 1.2

The details of foundation analysis are given in the subsequent paragraph.

7.1 ANALYSIS OF SHALLOW FOUNDATION

7.1.1 From Shear Failure Criteria

Net Safe Bearing capacity from Shear Failure consideration has been computed in accordance with IS: 6403-1981, which is based on, modified Terzaghi's classical approach. The weighted average of shear strength parameters for various strata upto depth equal to 0.5*B*Tan (45+Ø/2) (where B = Width of the Foundation, Ø = Angle of internal friction) is used in the analysis. A factor of safety of 2.5 to estimate the net safe bearing capacity from ultimate net bearing capacity.

For soils, containing both coarse grained (gravels & sands) and fine grained (clays), c and Φ are used to determine the soil strength. In case of predominantly fine grained soils, c and Φ are determined by the Triaxial Compression test as per IS: 2720 pt XI. For predominantly coarse grained soils, c and Φ are determined by Direct Shear test as per IS: 2720 pt XIII. These c and Φ values were used for determining the SBC of soil as per shear failure criteria.

The ultimate net bearing capacity in case of general shear failure is given by following expression,

$q_d = c\, N_c\, s_c\, d_c\, i_c + q\,(N_q-1)\, s_q\, d_q\, i_q + (1/2)\, B\, \gamma\, N_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$

The ultimate net bearing capacity in case of local shear failure is given by following expression,

$q'_d = (2/3)\, c\, N'_c\, s_c\, d_c\, i_c + q\,(N'_q-1)\, s_q\, d_q\, i_q + (1/2)\, B\, \gamma\, N'_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$

Where,

$d_c = 1+ 0.2\,(D_f/B)*SQRT(N_\phi)$

$d_q = d_\gamma = 1$ for $\phi < 10^o$

$d_q = d_\gamma = 1 + 0.1\ (D_f/B)*SQRT(N_\phi)$ for $\phi > 10^o$

$N_\phi = \tan^2(\pi/4 + \phi/2)$

ϕ' for local shear failure = $\tan^{-1}(0.67 \tan\phi)$

7.1.2 From Settlement Failure Criteria

Allowable Bearing Pressure from Settlement Failure consideration has been computed in accordance with IS: 8009 (Part-I). The magnitude of settlement, when foundation loads are applied, depends upon the compressibility of the underlying strata and rigidity of the substructure.

The total permissible settlement in cohesion-less soil is estimated using SPT value as per IS: 8009 (Part-I). While using this approach, the N value was corrected, wherever applicable, below the footing base to at least 1.5B below the base to account for the effects of energy ratio, adopted bearing pressure, dilation for submerged silty fine sands / fine sands as well as that due to the overburden pressure.

Further for settlement Calculation in cohesive soil the following equation has been used.

$S_t = \Delta P\ M_v\ H$

Where,

M_v = Coefficient of volume compressibility, cm^2/kg

ΔP = Pressure increment, kg/cm^2

H = Thickness of layers

Note: - Value of Coefficient of volume compressibility (Mv) has been calculated by using the following co-relation [Ref. Stroud and Butler, 1975] :-

Coefficient of Volume Compressibility derived from SPT N-Value (after Stroud and Butler, 1975)

Plasticity Index (%)	Conversion Factor (f_2)	m_v (10^{-3} kPa^{-1}) based on N-Value: $m_v = 1/(f_2N)$				
		N=10	N=20	N=30	N=40	N=50
10	800	0.12	0.06	0.04	0.03	0.02
20	525	0.19	0.09	0.06	0.05	0.04
30	475	0.21	0.10	0.07	0.05	0.04
40	450	0.22	0.11	0.07	0.06	0.04

$Mv = 1/(f_2 N_{corr.})$

Where f_2 = factor based on $N_{corr.}$ Value & plasticity index of soil

$N_{corr.}$ = corrected SPT 'N' value

For analysis of shallow foundation the total permissible settlement has been considered as 25mm, & 50mm as per IS 1904.

Zone of influence below foundation has been considered up to 1.5 times the width of the foundation.

For the determination of the SBC from settlement criteria, the corrected SPT N values within the influence zone are given in the table below.

NOTE:-

- Lower of the two values obtained from settlement and shear criteria is used in arriving at allowable bearing capacity of the soil.
- Structural foundations are designed based on the minimum of Safe Bearing Capacity obtained from Shear Failure Criteria and Allowable Bearing Pressure corresponding to the permissible settlement. The permissible Settlement that can be allowed for the foundation depends on the strata at the location and type of foundation (whether Isolated or Raft).

  Settlement occurs with the application of loads on foundations. It has two components, Immediate Settlement and Long Term Settlement. The immediate settlement takes place immediately as the loading is imposed on the structure and long term settlement arises due to the consolidation of the sub-soil with time under the load. Hence, the total settlement allowed for a foundation is the sum of the immediate and consolidation settlement that is expected to occur. The cohesionless strata (predominantly sandy) is primarily subjected to immediate settlement and cohesive strata (clayey) undergoes settlement in long time with the compression of the strata due to consolidation. Settlement of the foundation is determined from the relation provided in Indian standards (IS: 8009 (part-1) &/or various literatures (Bowles, BM Das, etc.).

From the Geotechnical investigation conducted on our site along with subsequent laboratory tests on soil samples, it is observed that predominantly the strata is silty with sand (SM/SC/SM-SC/ML-CL i.e. predominantly cohesionless) with the presence of small patches of silty clay of low plasticity (CL). Since the Settlement that takes place in cohesionless strata is mostly immediate, it takes place immediately after the imposing of load, initially during construction with the application of Dead Load and further during Live Load. The live load usually is many times lesser than the dead load, and correspondingly the post construction settlement is very less for live loads. As an example, if dead load is three times that of live load, then the settlement corresponding to live load (i.e. the post construction settlement) will be one-third of the settlement due to dead load which is comparatively lesser than 25mm for permissible settlement of 50mm.

According to the IS 1904, the permissible settlement for concrete structure having raft foundation is allowed upto 75mm, and the permissible settlement is 25mm post construction as per IRS code (Code of Practice for The Design of Sub-Structures and Foundations of Bridges). As discussed above, the settlement post construction is directly proportional to the allowable settlement. Therefore, given the importance of structure to be constructed and considering mostly cohesionless strata encountered at site, it is recommended that the maximum permissible settlement shall be restricted to 50mm for the design purpose on conservative side so that the post construction settlement can be constraint to lesser than 25mm.

As per IS- 8009 part 1 clause 9.2.2.1, If the clay layer is sandwitched between cohesionless soil layers, the immediate settlement is zero. Hence, even though the immediate settlement has been calculated during analysis, however it is ignored in the calculation of total settlement.

The sample calculations for computation of allowable bearing capacity of sub-strata for shallow foundation vide **Appendix – C-2.**

7.2 ANALYSIS OF PILE FOUNDATION

(A) DEEP FOUNDATION

The safe Load Carrying Capacity of normal bored cast in-situ RCC pile is determined in compression, uplift and lateral as per IS: 2911 (Part-1/sec-2) – 2010. The axial capacity of a pile depends upon the soil skin friction along the shaft and end bearing at it's tip.

Thus Axial load = Skin Friction + End-bearing

a) For piles in granular soils (using the static formula)

$$\mathbf{Q_u = (0.5*D*\gamma*N_\gamma + P_D*N_q)*A_p + (\Sigma K_i*P_{Di}*\tan\delta_i)*A_{si}}$$

Where,

Q_u = Ultimate load capacity of pile in KN

D = dia. of pile shaft in m

γ = effective unit weight of the soil at pile tip in kN/m^3

N_γ & N_q = bearing capacity factors depending upon the angle of internal friction Φ at pile tip (N_γ from IS 6403 for general shear failure case & N_q from Fig. 1, IS 2911)

P_D = effective overburden pressure at pile tip in kN/m^2 limited to 15-17 times diameter of pile (as per the Phi value at end bearing)

Σ = Summation for layers (1 to n) in which pile is installed and which contribute to (+ve) skin friction

K_i = coefficient of earth pressure applicable for the ith layer

P_{Di} = effective overburden pressure for the ith layer in kN/m^2 limited to 15-17 times diameter of pile (as per the Phi value at end bearing)

δ_i = angle of wall friction between pile and soil for ith layer, and

A_{si} = surface area of pile shaft in the ith layer in m^2

b) For piles in cohesive soils (using the static formula)

$$Q_u = cp*Nc*A_p + \Sigma\alpha_i*c_i*A_{si}$$

Where,

Q_u = Ultimate load capacity of pile in KN

A_p = cross-sectional area of pile tip in m^2

N_c = bearing capacity factor (= 9)

Σ = Summation for layers (1 to n) in which pile is installed and which contribute to (+ve) skin friction

α_i = adhesion factor for the i^{th} layer depending on the consistency of soil

c_i = average cohesion for i^{th} layer in kN/m^2

A_{si} = surface area for pile shaft in the i^{th} layer in m^2

c) For computation of safe load carrying capacity of pile in lateral, the following equation has been used:

i. **Fixed Head Condition**

$$Q = (12 * E * I * Y) / (L_1 + L_f)^3$$

ii. **Free Head Condition**

$$Q = (3 * E * I * Y) / (L_1 + L_f)^3$$

Where,

Q = Lateral Load (in kg)

Y = Permissible lateral deflection taken as 5mm

E = Modulus of Elasticity of concrete

I = Moment of Inertia of the pile cross-section

L_1 = Length of pile above cut-off level

L_f = Length of fixity

The effective length of the pile has been considered below the cut-off level taken as 2.0m below the EGL. Normal Bored cast in-situ RCC piles having stem diameter equal to 100cm & 120cm and of effective length varying from 20.0m to 30.0m were selected.

For the analysis of the pile foundations the soil parameters used for computation of safe load carrying capacity of pile is tabulated below:-

Table 3.3 : Design Soil Parameter

Design parameter have been obtain from the laboratory test results however various depth where the shear parameter seems on the lower side with respect to SPT ‘N’ values those shear parameter have been judicially improved based on the SPT ‘N’ for the analysis purpose.

The sample calculation for computation of safe load carrying capacity of normal bored cast-in-situ RCC pile in compression & uplift are attached vide **Appendix C-3.**

The sample calculation for computation of safe load carrying capacity of normal bored cast-in-situ RCC pile in lateral are attached vide **Appendix C-4.**

CHAPTER 4 FOUNDATION RECOMMENDATIONS

8.0 FOUNDATION RECOMMENDATIONS

- Based on the nature & strength characteristics of the substrata and requirement of the project, shallow foundation and normal bored cast in-situ RCC pile foundation have been analyzed.
- Based on the method of analysis & design parameters given under Para 7.1 above, the recommended net allowable bearing capacity values are given in Table 4.1 to 4.2.

Table 4.1: Recommended Net Allowable Bearing Capacity for shallow foundation for allowable settlement 25mm

Chainage Old (km)	Chainage New (km)	BH. No.	Foundation Size (m x m)	Depth of foundation below EGL (m)	Net Safe Bearing Capacity from Shear Failure (t/m^2)	Net Allowable Bearing Pressure from settlement failure (t/m^2)	Recommended Net Allowable Bearing Capacity (t/m^2)
(-)2+514	(-)1+838	BH-CL	8.0 x 8.0	1.0	26.6	16.4	16.4
			8.0 x 8.0	2.0	31.4	16.4	16.4
			8.0 x 8.0	3.0	36.4	16.5	16.5
(-)1+969	(-)1+291	BH-CL	4.8 x 4.8	1.0	17.2	11.7	11.7
			4.8 x 4.8	2.0	21.2	13.9	13.9
			4.8 x 4.8	3.0	25.3	17.0	17.0
(-)1+500	(-)0+821	BH-A1	7.2 x 7.2	2.0	21.0	10.2	10.2
			7.2 x 7.2	3.0	23.3	10.8	10.8
			7.2 x 7.2	4.0	25.4	11.6	11.6
		BH-A2	7.2 x 7.2	2.0	35.6	12.9	12.9
			7.2 x 7.2	3.0	36.8	17.3	17.3
			7.2 x 7.2	4.0	38.0	26.2	26.2
(-)1+269	(-)0+592	BH-A1	7.2 x 7.2	2.0	21.7	14.9	14.9
			7.2 x 7.2	3.0	25.8	26.3	25.8
			7.2 x 7.2	4.0	28.3	27.8	27.8
		BH-A2	7.2 x 7.2	2.0	24.5	15.1	15.1
			7.2 x 7.2	3.0	29.2	26.3	26.3
			7.2 x 7.2	4.0	32.0	27.8	27.8
(-)1+241	(-)0+567	BH-CL	2.7 x 2.7	1.0	14.9	15.1	14.9
			2.7 x 2.7	2.0	22.6	18.7	18.7
			2.7 x 2.7	3.0	30.7	21.7	21.7
(-)0+934	(-)0+248	BH-CL	4.8 x 4.8	1.0	23.3	19.2	19.2
			4.8 x 4.8	2.0	31.7	20.7	20.7
			4.8 x 4.8	3.0	40.6	20.7	20.7

* The maximum value of recommended net allowable bearing capacity shall be restricted to 30 t/m^2.

Table 4.2: Recommended Net Allowable Bearing Capacity for shallow foundation for allowable settlement 50mm

Chainage Old (km)	Chainage New (km)	BH. No.	Foundation Size (m x m)	Depth of foundation below EGL (m)	Net Safe Bearing Capacity from Shear Failure (t/m^2)	Net Allowable Bearing Pressure from settlement failure (t/m^2)	Recommended Net Allowable Bearing Capacity (t/m^2)

Notes : -

1. Permissible lateral deflection has been taken as 5 mm.
2. The self weight of the pile has been taken into account while computing the Safe Load Carrying Capacity of Pile in uplift only and not considered for vertical load capacity in compression.
3. The safe load carrying capacity of piles have been worked out on the basis of IS: 2911 (Part-1/sec-2) – 2010 as per provisions / assumptions provided therein & are only an assessment based on characteristics of the sub-strata obtained at the locations of the above BHs. The safe load carrying capacities as tabulated above will further depend substantially on the piling technique adopted and equipment used for making the piles in the field. However, for the final designs & constructions, the safe/allowable load carrying capacities of these piles should be taken by conducting actual initial load tests on these piles by casting them in the respective areas.
4. While erecting normal bored cast in-situ pile, utmost care should be taken while flushing/cleaning the bottom of pile particularly prior to start of pouring of concrete so as o rest the pile in virgin soil only for obtaining full point bearing as while computing safe load carrying capacity of pile no bottom softening during erection of pile has been considered.
5. Further the pile should have necessary structural strength to transmit / sustain the design load.

All The above recommendations are based on the field and laboratory tests conducted on selected soil/ rock core samples and our experience in this regard. If the actual substrata conditions during excavation for the foundation differ from the observations reported here, the design experts/consultants should be referred for suggestion, further investigations.

FIELD BOREHOLE LOG

Project Name :GTI for (HORC) project from Palwal to Harsana Kalan in the state of Haryana.		*Client* :HRIDCL
BH Location/Chainage :(-)0+934 km	*Northing* :3126250.134 m	*Easting* :721203.669 m
Reduced Level (m):(+)196.343	*BH. No.* :BH-CL	*BH Termination Depth (m)*:10
Proposed / Existing Structure :Minor Bridge	*Water Table (m)*:8.10	*Inclination* : Vertical
Boring type :Rotary	*Dia. of Boring* :150 mm	*Depth of Casing (m)* :Not Used
Date of Start :14-10-2021	*Date of Completion* :14-10-2021	

Depth (m)	In-Situ Sample Depth (m)	Sample Type	Blow counts per 15cm N1	N2	N3	SPT N Value	Strata Description	IS Classification	Graphic Log	(Depth v/s SPT N Value)	Special Observations

Note:-
NR - BH's as Liquefible depth more than 4m. (Suitable ground improvement methods are recommended.

SYMBOL	DESCRIPTION
	SM- Silty Sand (Having fines Less Than 50% and no plasticity or below A-line)
	SM-SC -Clayey Sand (Having fines Less Than 50% and in the hatched zone (4<PI<7)
	ML-CL -Sandy with clay (Having fines greater than 50% and in the hatched zone (LL<35 & 4<PI<7)
	CL-Silty Clay of low plasticity (Above A-line, LL<35)
	CI- Clay of medium plasticity (Above A-line, 35≤LL<50) — LIQUEFACTION
	BOREHOLE REQUIRED — WATER TABLE

Note:- Fines= Percentage of Silty + Clay A-line=.73(wl-20) SCALE:- HOR:- 1:2850 SCALE:- VER:- 1:285

Calculation of SBC for shallow foundations as per IS : 6403 - 1981

INPUT DATA

CH. (KM) :- (-)1+969

BH NO. :- BH-CL

Type of footing

1 Continuous Strip
2 Rectangular
3 Square
4 Circular

Square **3**

Angle of internal friction (ϕ^o)	26.00
Cohesion (c in t/m^2)	1.80
Void ratio (e), $e = (G.\gamma_w/\gamma_d)-1$	0.77
Direction of load with vertical (^{o})	0.00
Density of foundation soil (t/m^3) γ_{bulk}	1.70
Depth of water table(m)	4.50
Factor of safety	2.50

S.no.	Depth (m) of footing (D_f) below EGL	Width (m)
1	1.00	4.80
2	2.00	4.80
3	3.00	4.80

SHEAR FAILURE CRITERIA

Assumptions and formula used in calculation as per IS:6403-1981 are given below -

NOTE: The type of failure used for bearing capacity analysis depends upon the value of void ratio (see IS 6403 : 1981, Page No. 9, Table No. 3).

The ultimate net bearing capacity in case of general shear failure is given by (from IS 6403 : 1981, page No. 8)

$$q_d = c\,N_c\,s_c\,d_c\,i_c + q\,(N_q-1)\,s_q\,d_q\,i_q + (1/2)\,B\,\gamma\,N_\gamma\,s_\gamma\,d_\gamma\,i_\gamma\,W'$$

The ultimate net bearing capacity in case of local shear failure is given by (from IS 6403 : 1981, page No. 8)

$$q'_d = (2/3)\,c\,N'_c\,s_c\,d_c\,i_c + q\,(N'_q-1)\,s_q\,d_q\,i_q + (1/2)\,B\,\gamma\,N'_\gamma\,s_\gamma\,d_\gamma\,i_\gamma\,W'$$

Where,

$d_c = 1+ 0.2\,(D_f/B)*SQRT(N_\phi)$

$d_q = d_\gamma = 1$ for $\phi < 10^o$

$d_q = d_\gamma = 1 + 0.1\,(D_f/B)*SQRT(N_\phi)$ for $\phi > 10^o$

$N_\phi = \tan^2(\pi/4 + \phi/2)$

(from IS 6403 : 1981, page No. 9)

ϕ' is friction angle for local shear failure = $\tan^{-1}(0.67 \tan\phi)$

OUTPUT

The computer aided results for shear failure criteria are tabulated below. The results are interpolated values of bearing capacity obtained from general and local shear failure criteria.

Bearing capacity factors : (from IS 6403 : 1981, page No. 8, Table No. 1)

ϕ	26.00	ϕ'	18.10
N_c	22.25	N'_c	13.18
N_q	11.85	N'_q	5.31
N_γ	12.54	N'_γ	4.12

Shape factors : (from IS 6403 : 1981, page No. 8, Table No. 2)

Calculation of SBC for shallow foundations as per IS : 6403 - 1981

INPUT DATA

CH. (KM) :- (-)1+969

BH NO. :- BH-CL

Type of footing

1 Continuous Strip
2 Rectangular
3 Square
4 Circular

Square **3**

Angle of internal friction (ϕ °)	26.00
Cohesion (c in t/m^2)	1.80
Void ratio (e), e = $(G.\gamma_w/\gamma_d)-1$	0.77
Direction of load with vertical (°)	0.00
Density of foundation soil (t/m^3) γ_{bulk}	1.70
Depth of water table(m)	4.50
Factor of safety	2.50

S.no.	Depth (m) of footing (D_f) below EGL	Width (m)
1	1.00	4.80
2	2.00	4.80
3	3.00	4.80

SHEAR FAILURE CRITERIA

Assumptions and formula used in calculation as per IS:6403-1981 are given below -

NOTE: The type of failure used for bearing capacity analysis depends upon the value of void ratio (see IS 6403 : 1981, Page No. 9, Table No. 3).

The ultimate net bearing capacity in case of general shear failure is given by (from IS 6403 : 1981, page No. 8)

$$q_d = c\, N_c\, s_c\, d_c\, i_c + q\,(N_q-1)\, s_q\, d_q\, i_q + (1/2)\, B\, \gamma\, N_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$$

The ultimate net bearing capacity in case of local shear failure is given by (from IS 6403 : 1981, page No. 8)

$$q'_d = (2/3)\, c\, N'_c\, s_c\, d_c\, i_c + q\,(N'_q-1)\, s_q\, d_q\, i_q + (1/2)\, B\, \gamma\, N'_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$$

Where,

$d_c = 1+ 0.2\,(D_f/B)*SQRT(N_\phi)$

$d_q = d_\gamma = 1$ for $\phi < 10^o$

$d_q = d_\gamma = 1 + 0.1\,(D_f/B)*SQRT(N_\phi)$ for $\phi > 10^o$

$N_\phi = \tan^2(\pi/4 + \phi/2)$

(from IS 6403 : 1981, page No. 9)

ϕ' is friction angle for local shear failure = $\tan^{-1}(0.67 \tan\phi)$

OUTPUT

The computer aided results for shear failure criteria are tabulated below. The results are interpolated values of bearing capacity obtained from general and local shear failure criteria.

Bearing capacity factors : (from IS 6403 : 1981, page No. 8, Table No. 1)

ϕ	26.00	ϕ'	18.10
N_c	22.25	N'_c	13.18
N_q	11.85	N'_q	5.31
N_γ	12.54	N'_γ	4.12

Shape factors : (from IS 6403 : 1981, page No. 8, Table No. 2)

S.no.	Width(m)	S_c	S_q	S_γ
1	4.80	1.30	1.20	0.80
2	4.80	1.30	1.20	0.80
3	4.80	1.30	1.20	0.80

Depth factors : (from IS 6403 : 1981, page No. 9)

S.no.	Depth(m)	Width(m)	dc	d_q	d_γ
1	1.00	4.80	1.07	1.03	1.03
2	2.00	4.80	1.13	1.07	1.07
3	3.00	4.80	1.20	1.10	1.10

Inclination factors : (from IS 6403 : 1981, page No. 9)

$i_c = (1-\alpha / 90)^2$	$i_q = (1-\alpha / 90)^2$	$i_\gamma = (1- \alpha / \phi)^2$
1.00	1.00	1.00

Water table factor : (from IS 6403 : 1981, page No. 9)

S.no.	Depth(m)	Width(m)	Z_w/B	W'
1	1.00	4.80	0.73	0.86
2	2.00	4.80	0.52	0.76
3	3.00	4.80	0.31	0.66

Safe Bearing Capacity

S.no.	Depth(m)	Width(m)	SBC in (t/m^2)		
			General shear	Local shear	Recommended
1	1.00	4.80	45.98	17.21	17.21
2	2.00	4.80	55.76	21.18	21.18
3	3.00	4.80	66.02	25.34	25.34

Subject :- Geotechnical investigation work for Haryana Orbital Rail Corridor (HORC) project from Palwal to Harsana Kalan in the state of Haryana.

Dear Sir,

We are pleased to submit this report of the subject work based on 76 boreholes carried out at New Ch. 0+000 to Old Ch. 10+859 (New Ch: 11+543) & Old Ch. 17+625 to Old Ch. 20+300 (New Ch: 18+310 to 20+985) for the proposed project site.

The accompanying report presents results of various field tests and laboratory tests conducted on selected soil samples and their interpretation.

Should there be any clarifications regarding the contents please contact us at your most convenient time.

We value the opportunity to participate in this project and look forward a pleasant association on future projects.

Very truly yours,
CEG Test House & Research Centre Pvt. Ltd.

CHAPTER 1 GENERAL

1.0 INTRODUCTION:

The work of conducting "**Conducting geotechnical investigation, preparation of geotechnical report for designing of bridges and for embankment in connection with construction of Haryana Orbital Rail Corridor (HORC) project from Palwal to Harsana Kalan including connectivity to existing IR network in the state of Haryana"** was awarded to "**CEG Test House & Research Centre Pvt. Ltd., Jaipur" by M/S.** "**Haryana Rail Infrastructure Development Corporation Ltd. (HRIDCL)"** as per work order no. HRIDC/ HORC/ GT/ CEG/ 237/ 2021/ 577-M dated 29th July 2021.

Field work including drilling of boreholes, conducting field tests such as Electrical Resistivity Test, & Plate Load Test and sample collection was carried out in the presence of representative of Client. Laboratory tests were conducted on selected soil samples to determine the design parameters, confirming to relevant IS specifications and the guidelines received from time to time from representative of Client.

This report includes the details of Methodology of Investigation, collection of samples of soil, field test results, laboratory test results, analysis of results and recommendations for proposed structure carried out at New Ch. 0+000 to Old Ch. 10+859 (New Ch: 11+543) & Old Ch. 17+625 to Old Ch. 20+300 (New Ch: 18+310 to 20+985) based on soil sample collected from the locations of 76 boreholes.

2.0 SITE LOCATION & GENERAL GEOLOGICAL HISTORY:

The details of the site & test locations for the proposed project are shown in location plan attached vide **Appendix A-1**. The site of proposed project is located from Palwal to Harsana Kalan (Sonipat) in the State of Haryana falls in seismic zone – IV (Zone factor=0.24) of India.

Soil of the Haryana Sub-Region have been classified and described under the following major soil types as shown below:-

- Typic Ustochrepts : Soil of old alluvial plains
- Typic Ustipsamments : Soil of Aravali plains
- Typic Ustifluvents : Soil of recent alluvial plains and flood plains
- Typic Torripsamments : Soil of Aeofluvial plains
- Rocky Outcrops : Aravali rocky hills

The district wise details of soil characteristics are described below:-

Panipat: The soils are well drained, Sandy loam to clay loam/silty clay loam in plains and loam to clay loam/ silty/ loose clay loam in relic channels/depressions/basins.

Sonipat: The district comprises of recent flood plains, young meander plains, old meander plains and old alluvial plains. Recent flood plains occur along the Yamuna River and clearly show fluvial features. The soils are loamy sand to sandy loam on the surface and sandy loam to clay loam in the sub surface.

Rohtak: The district mainly comprises of old alluvial plains. The soils are loamy sand to sandy loam on the surface and sandy loam to clay loam in the sub surface. Old meander plains are almost flat with loamy sand to silty clay loam soils. Oldest among all the land forms are old alluvial plains, which cover major areas in the district. These soils are sand to loamy sand/sandy loam (surface) to silt loam/silty clay loam (sub-surface).

Jhajjar: The district mainly comprises of old alluvial plains and some parts of the district also have soil belonging to Aravali plains.

Rewari: The soils of the district fall under Entisols and Inceptisols orders. The surface soil texture varies from sand to fine loamy sand.

Gurgaon: The district comprises of sand dunes, sandy plains, alluvial plains, salt affected areas, low lands, lakes, hills and pediments. The soil varies from sand to loamy sand in sand dunes and sandy plain areas, sandy loam to clay loam / silty clay loam in alluvial plains, calcareous, loamy sand to loam in salt affected plains, silty loam to loam in low lands and calcareous, loamy sand to loam in hills.

Mewat: The soils of the area are generally sandy loam to loam. In parts of the low-lying areas, they are clayey and saline. The upper hills are mostly barren.

Faridabad and Palwal: The district comprises of recent Yamuna flood plains, low lying plains, depressions, sand dunes and hills. The texture of the soil is sand to loamy sand in recent Yamuna flood plains, sandy loam in plains, sandy loam to clay loam in alluvial plains, sandy loam to loam (surface), clay loam/silty clay (sub-surface) in low lying plains and depressions.

3.0 SCOPE OF WORK:

The stipulated scope of work involved carrying out the following operations:-

a) Mobilisation of necessary plant equipment, men and materials for the complete Geotechnical investigation work as per specifications, drawings and instructions of the Engineer and to complete the same within the stipulated time schedule and demobilisation after completion of field work.
b) Shifting of Equipments from one structure location to another including Ereaction, installation of rigs at site and dismantling of the same after completion of field work. Shifting of setup for each borehole location and associated preparation for borehole under water
c) Making 150 mm nominal diameter boreholes at various locations in all types of soils except hard rock and large boulders using suitable approved method of boring including chiselling, cleaning, providing casing pipe as required; performing Standard Penetration Test at every 3.0m interval and at change of strata; collection of water samples and disturbed soil samples, observation such as ground water, etc., collection of undisturbed soil samples at every 3.0 m interval and at change of strata; transportation of all the collected samples to the laboratory and back filling of boreholes on completion of the same, complete as per specification and instructions of the Engineer, for depths below natural ground level.
d) Conducting Electrical resistivity tests at various locations all complete as per specification and directions of the Engineer.
e) Conducting plate load test at various locations, all complete as per specification and directions of the Engineer.
f) Drilling of Nx size boreholes (75mm dia.) in all types of hard rock, collection of core samples, maintaining continuous record of core recovery/ RQD, keeping the cores in wooden core boxes, transporting to laboratory, backfilling on completion of the same, all complete as per specification and instructions of the EIC.
g) Conducting various laboratory tests on soil samples at an approved laboratory including preparation of soil samples to determine the following properties of soil, all complete as per specification.

<u>On soil Samples</u>

- Dry density test
- Bulk Density and Moisture Content.
- Sieve Analysis
- Hydrometer Analysis
- Liquid Limit and Plastic Limit
- Specific gravity
- Shrinkage Limit
- Free Swell Index
- Direct Shear Test
- Triaxial Shear Test

- One Dimensional consolidation test
- Chemical Analysis of soil samples (pH, chloride, Sulphate)

h) Conducting laboratory tests on rock samples including preparation of the samples to determine the following properties, all complete as per specification

On Rock Samples

- Moisture content, porosity & Density
- Specific gravity
- Hardness
- Unconfined compression test
- Point load strength index
- Modulus of Elasticity and Poission's Ratio
- Abrasion Test

i) Conducting chemical tests on water samples to determine the Sulphate, chloride and pH value all complete as per specification.

j) Submitting draft report in soft copy including all field records and laboratory test results, graphs, etc., all complete as per specifications.

k) Submitting final report in three hard copies in after the approval of the draft report including all field records and laboratory test results, graphs, etc., all complete as per specifications.

4.0 FIELD INVESTIGATION IN SOIL STRATA:

The investigation was planned to obtain the subsurface stratification in the proposed project site and collect soil / rock core samples for laboratory testing to determine the engineering properties such as shear strength, along with basic engineering classification of the subsurface stratum.

For geotechnical investigation work, required equipements along with rotary drilling rigs and manpower were mobilized at site to carry out various field activities as per the scope of work. These were shifted from one test location to another location during execution of field work and were demobilized on satisfactory completion of field work.

For conducting the field investigations the following practices were followed at site:

- The locations of 76 boreholes carried out at New Ch. 0+000 to Old Ch. 10+859 (New Ch: 11+543) & Old Ch. 17+625 to Old Ch. 20+300 (New Ch: 18+310 to 20+985) were marked at site at specified locations. These locations are shown in **Appendix-A1** attached subsequently.

The details of various boreholes along with their coordinates are provided herein below:

***NE=Not Encountered**

- In soil, boreholes of 150mm dia. were drilled as per the standard procedure laid in IS: 1892.
- Borehole was properly cleaned before taking any sample in soil.

- Casing was used as per the prevailing soil conditions, to stabilize the borehole.
- Standard Penetration Tests were conducted in bore holes at regular intervals or at every change of strata as per Technical specification.
- Undisturbed were collected wherevery feasible as per the requirements and at specified depths. The same has been discussed in detail in soil characteristics sheets attached with the report.
- The Ground Water Table was met at depths of from 0.29m to 24.90m below EGL. The detailed procedure adopted for conducting various field tests is given here in below:

(i) Standard Penetration Test:

The Standard Penetration Test was conducted in boreholes as per IS 2131. The test was carried out using the standard split spoon sampler to measure the number of blows 'N'.

Standard split spoon sampler was attached to an 'A' rod. It was driven from borehole bottom to a distance of 45 cm using a standard hammer of 63.5 kg falling freely from a height of 75 cm to the required depth. While driving, the number of blows required to penetrate every 15 cm are recorded. The total number of blows required for the last 30 cm is taken as 'N' value at that particular depth of the borehole. Wherever the total penetration was less than 45cm, the no. of blows & the depth penetrated is recorded in the respective borelog.

SPT 'N' values were correlated with relative density of non-cohesive stratum and with consistency of cohesive stratum as given below:-

Table 1.2: Soil compactness as per SPT N values (cl. 9.7, table 9.3 & 9.4, page 330_text book of V.N.S. Murthy)

Correlation for Clay / Plastic silt		Correlation for Sand / Non-Plastic silt	
Consistency	**SPT "N" Value**	**Compactness**	**SPT "N" Value**
Very Soft	0 - 2	Very Loose	0 - 4
Soft	2 - 4	Loose	4 - 10
Medium	4 - 8	Medium	10 - 30
Stiff	8 - 15	Dense	30 - 50
Very Stiff	15 - 30	Very Dense	> 50
Hard	> 30		

The field SPT N values obtained were further corrected as per the guidelines given in IS: 2131 as follows:

(a) For overburden: - The N value for cohesionless soil is corrected with the help of fig. 1 given in IS-2131.

(b) Due to dilatancy :- Wherever N values observed below water table in fine sand, silty sand or silt was greater than 15, then corrected N values were corrected as under:

$$N' = 15 + \frac{1}{2}(N-15)$$

(ii) Undisturbed Sampling (Soil) in boreholes:

Undisturbed samples were collected using MS tubes of suitable diameter and length with Area ratio as per clause 4.1.1 (c) of IS: 1892 (latest) fitted to an adopter with ball and socket arrangement. Before taking any sample, sampling tube was properly greased. Immediately after taking on undisturbed sample in a tube, the adopter head was removed along with the disturbed material. The visible ends of the sample were trimmed off any wet disturbed soil. The ends were coated alternately with four layers of just molten wax. More molten wax was added to give a total thickness of min. 25 mm. The samples were carefully labeled and transported to the laboratory for testing. Undisturbed samples wherever slipped during lifting were duly marked in the field logs as well as in the soil profile.

4.1 CONDUCTING PLATE LOAD TESTS

The reaction Load is applied on the test plate by reaction truss with a weight of several tonnes. The Plate Bearing Test is normally carried out at foundation level, either on the surface or in a shallow pit. The Size of Plate is 45 cm x 45 cm size (30mm thickness) and 60 cm x 60 cm size (30mm thickness) by the hydraulic jack. The test plate was placed over a horizontal sand layer of thickness 5 mm and leveled in a manner such that the center of the plate coincides with the center of application of load. The load was applied with hydraulic jack along with a pressure gauge. Settlement of the plate was measured by using two dial gauges, fixed to reference datum bars placed on firm ground, on either side of the plate. Desired seating pressure was applied on firmly seated test plate. Settlement was recorded for each increment of load. Loading was continued till a settlement of 25 mm occurred or up to desired loading intensity as per directions.

PLATE LOAD TEST LIMITATIONS

Plate load test, though useful in obtaining the necessary information about the soil with particular reference to design of foundation has some limitations:-

(a) The tests results reflect only the character of the soil located within a depth of less than twice the width of the bearing plate. Since the foundations are generally larger than the test plates, the settlement and shear resistance will depend on the properties of much thicker stratum. Moreover this method does not give the ultimate settlements particularly in case of cohesive soils. Thus the results of the test are likely to be misleading, if the character of the soil changes at shallow depths, which is not uncommon. A satisfactory load test should, therefore, include adequate soil exploration (see IS: 1892-1979) with due attention being paid to any weaker stratum below the level of the footing.

(b) Another limitation is the concerning of the effect of size of foundation. For clayey soils the bearing capacity (from shear consideration) for a larger foundation is almost the same as that for the smaller test plate. But in dense sandy soils the bearing capacity increases with the size of the foundation. Thus tests with smaller size plate tend to give conservative values in dense sandy soils. It may, therefore, be necessary to test with plates of at least three sizes and the bearing capacity results extrapolated for the size of the actual foundation (minimum dimensions in the case of rectangular footings).

(c) It has limited depth of influence. It could only give the bearing capacity of soils with depth up to two times the diameter of plate.

(d) It may not provide information on the potential for long term consolidation of foundation soils.

(e) There is scale effect as the size of test plate is smaller than actual foundation.

(f) To gain access to test position, excavation is carried out which causes significant ground disturbance. The change in ground stress leads to the change of soil properties which the test is planned to investigate.

Hence the interpretation of the test results & recommendation has been made in view of the above limitations.

The field record of applied load and respective average settlement obtained for plate load tests is being tabulated herein below :

Plate Load Test Data PLT-09 (New Ch. 0+000)

Applied Load (T)	Applied Pressure (T/m^2)	Cumulative Settlement (mm)
0.000	0.00	0.00
1.020	5.04	0.94
2.039	10.07	2.40
3.059	15.11	4.82
4.078	20.14	9.04
5.098	25.18	14.57
6.118	30.21	19.53
7.137	35.25	25.70

5.0 LABORATORY TESTS ON SOIL SAMPLES:

The following laboratory tests were conducted on selected soil samples:

Table 1.3: Description of Tests

Description of Test	Reference	Undisturbed (UDS) Soil Samples	Disturbed (DS/SPT) Soil Samples
Grain Size Analysis / Hydrometer	IS: 2720 (Part - 4)	√	-
Natural Moisture Content / Bulk / Dry density	IS : 2720 (Part – 2)	√	-
Atterberg Limits • Liquid Limit • Plastic Limit	 IS: 2720 (Part - 5) IS: 2720 (Part - 5)	 √ √	 √ √
Specific Gravity	IS : 2720 (Part – 3)	√	-
Direct Shear Test	IS : 2720 (Part – 13)	√	-
Triaxial compressive shear test	IS : 2720 (Part – 11 & 12)	√	-
Chemical Analysis of Soil Samples	IS : 2720 (Part – 26, 27)	√	-

Note:- The detailed procedure adopted for conducting various laboratory tests is described in the following paragraphs:

5.1.1 Dry density and Bulk density

For determination of bulk density and dry density, a sample of known volume ‘V’ was extracted from the undisturbed sampling tube and it’s bulk weight ‘W’ was noted down.Moisture content ‘Wn’ was determined by oven drying method.

The bulk density and dry density were determined by following equation-

Bulk density (γ_b) = W/V

Dry density (γ_d) = γ_b/ (1+Wn)

5.1.2 Natural water content

For this test, the soil sample of known quantity (Wm) was taken in a container.The container with soil sample was placed into an oven for drying at 105-110°c temperature for 16-24 hours. After drying, the dry sample was again weighted to determine the dry weight of sample (Wd).

The natural water content was computed by the following equation-

Wn = (Wm-Wd)*100/Wd

5.1.3 Grain Size Analysis (IS: 2720- Part-4)

Wet sieve analysis:

For determination of particle sizes finer than 75 micron, wet sieve analysis test was conducted. For this test, oven dried sample of known quantity was taken in a container and soaked with dispersing agent. The soaked soil sample was washed thoroughly over 75 micron IS sieve until the water passing sieve was substantially clean.

Fraction retained on 75 micron IS sieve was carefully collected in a container without any loss in material and placed into oven for drying.

Dry sieve analysis:

For this test, the oven dried soil sample after wet sieving was sieved through the set of IS sieves 20 mm, 10 mm, 4.75 mm, 2.0 mm, 1.0 m , 425 micron , 300 micron, 150 micron and 75micron. The amounts of soil retained on each sieve were noted down. The % retained, cumulative % retained and % passing were computed accordingly. Wherever the soil sample % passing 75 micron sieve was significant, Hydrometer method was used to find the percentage of silt and clay fraction.

Grain size analysis for the fraction passing 75 micron IS Sieve (Hydrometer method)

Calibration of Hydrometer

Hydrometer was calibrated to determine a relationship (an equation) between the effective depth H_R and corresponding hydrometer reading R_h (obtained during test).

50 to 100 gm of soil sample passing through 75 micron IS Sieve was taken. It was mixed with 100 ml of sodium hexametaphesphate solution and the mixture was warmed for about 10 minutes. It was then transferred to the cup of the mechanical mixer and the soil suspension was stirred for 15 minutes. The soil suspension was transferred into 1000 ml measuring cylinder and distilled water was added to make 1000ml solution. This solution was mixed vigorously. The measuring cylinder was then allowed to stand and the stopwatch was started. Hydrometer was immersed in the solution and reading were taken after half, one, two and four minutes. The hydrometer was then removed slowly and kept in distilled water at the same temperature as the soil suspension. Readings were taken after the periods of 8, 15 and 30 minutes, and one, two and four hours. Hydrometer was removed, rinsed and placed in the distilled water after each reading. After 4 hours reading was taken once or twice within 24 hours. Finally a reading was taken at the end of 24 hours. The temperature of the suspension was observed and recorded.

Calculations

Diameter of the particles (D):

$$D = \sqrt{\frac{30\mu}{980(G-1)}} \times \sqrt{\frac{H_R}{t}} = M\sqrt{\frac{H_R}{t}}$$

Where,

D = diameter of particle in suspension, in mm;

μ = co-efficient of viscosity of water at the temperature of the suspension at the time of taking the hydrometer reading, in poise;

G = specific gravity of the soil fraction used in the sedimentations analysis;

H_R = effective depth corresponding to R_n, in cm.

t = time elapsed between the beginning of sedimentation and taking of hydrometer reading in minutes

$M = \sqrt{\frac{30\mu}{980(G-1)}}$ = a constant factor for given values of μ and G at the temperature of the suspension.

Percentage finer than diameter D:

The percentage by mass (w) of particles smaller than corresponding equivalent particle diameters (D) was calculated from the formula:

$$w = \frac{100G_s}{W_b(G_s - 1)} \times R_h$$

Where

w = percentage finer

G_s = specific gravity of soil particle

W_b = weight of soil

R_h = Hydrometer reading

5.1.4 Specific Gravity (IS: 2720-Part-3 Sec-1)

The specific gravity of soil sample was determined by density bottle method. For this test 5-10g oven dried and cooled soil sample was taken in 50ml capacity density bottle and its weight was noted down as W_2 .The soil was covered with distilled water and left for sufficient period for suitable soaking. The entrapped air was removed by vacuum. The bottle with soil was filled fully with water and its weight was noted down (W_3). The mass of empty bottle and bottle filled with distilled water were noted down as W_1 and W_4 respectively.

The Specific Gravity was determined by using following equation :

$G=W_2-W_1/[(W_2-W_1)-(W_3-W_4)]$

5.1.5 Liquid Limit (IS: 2720- Part-5)

By Cone Penetrometer Method

The 'Cone Penetrometer Apparatus' is a variant of the fall-cone and consists of a cone with a smooth polished surface and angle of 30° ± 1/2°. The weight of the cone, together with its associated shaft is 80g ± 0.5g. A support assembly with an automatic cone release mechanism and cone height adjustment mechanism used to hold the cone vertically. The angle and weight of the cone were calibrated at regular intervals, and the sharpness of the cone tip was checked daily.

Distilled water was added and thoroughly mixed with the soil sample to produce a homogeneous paste. The paste was then placed in a cup with a diameter of at least 55mm and a depth of at least 40mm. The surface of the soil was smoothed off level and parallel to the base. The support assembly was used to position the tip of the cone so that it was just touching the top surface of the soil, and the automatic tripping mechanism was released. The cone was allowed to penetrate into the soil for a period of 5 (± 1) s, then the cone was locked off to stop further movement and the penetration was recorded. The cup was refilled and the test was repeated. The two recorded penetrations need to be within 0.5mm of each other, otherwise a third test is performed. when the three test vary by more than 1mm the test was repeated.

Further tests were conducted, at varying water contents, in order to produce a series of cone penetrations (usually 4) in the range 15mm to 25mm. The resulting cone penetrations were plotted verses the water content of the test specimens. The Liquid Limit (W_L) was read off the graph, being the water content at which the line of best fit through the test points crosses 20mm penetration.

5.1.6 Plastic Limit (IS: 2720-Part-5)

For this test, soil sample was prepared in the same way as for liquid limit test. A ball of soil sample weighed about 5 gm was formed. The ball was rolled between the fingers of one hand and the glass plate with pressure sufficient to reduce the mass into a thread of about 3 mm in 5 to 10 complete forward and back movements. When a diameter of 3 mm was reached, soil was again remolded into a ball. The process of rolling and remolding was repeated until the thread started just crumbing at a diameter of 3 mm. The crumbled thread was immediately transferred to an airtight container for determination of its moisture content by oven drying method.

This water content has been termed as plastic limit. (W_P)

5.1.7 Plasticity Index (IS: 2720-Part-5)

The plasticity index Ip was given by

$I_p=W_L-W_P$ (in percent)

5.1.8 Direct Shear Test (IS:2720-Part-13):

For this test shear box test apparatus was used. The prepared specimen from remolded/undisturbed sample was placed carefully in the box. The plain grid was kept on top of the specimen with its directions at right angles to the direction of shear. The upper porous stone was placed on the grid and loading pad on the stone. The box with specimen was gently placed in the container (water jacket). The specimen was submerged with water. The container was mounted with the shear box and the specimen inside, on the shearing machine. The upper part of the box was so adjusted that it touchéd the proving ring. The jack was brought forward to bear up against the box container. The proving ring dial gauge was set to read zero.

The steel ball was placed in the recess of the loading pad. The loading yoke was set in contact with the steel ball on the loading pad. Vertical displacement dial gauge to read zero in contact with the top of the yoke. The normal load was applied and any change in thickness of specimen was recorded. Shear displacement dial gauge was also set to read zero. The locking screw was now removed and two parts of the shear box were separated by advancing the spacing screws.

The specimen was sheared at constant rate of strain. The readings of the proving ring dial gauge were noted down every 15 seconds for the first one-minute and then every 30 seconds thereafter. The reading of change in the thickness dial gauge and shear displacement dial gauge were also recorded at the same time interval. The test was continued until the specimen fails. The specimen was assumed to fail when the proving ring dial gauge started receding or at shear displacement of approximately 15% of the length took place.

The soil was removed from the box and test was repeated on the identical specimen under increased normal load.

The rate of strain for conducting Direct Shear Test is kept as 0.25 mm/min as per codal/literature provision based on strata.

5.1.9 Triaxial Shear Test_UUT (IS: 2720-Part-11)

For this test, Triaxial Shear Test apparatus was used. The plain disc was placed on the pedestal of the triaxial cell. The specimen was placed centrally on the disc. A correct size rubber membrane was fitted inside the stretcher with ends of membrane folded over those of the stretcher. Vacuum was applied to stretch the membrane to the inside surface of the stretcher which was carefully slipped around the specimen kept on the pedestal. The vacuum on the membrane was released. Its bottom part was rolled down into the pedestal. plain disc was placed on the top of the specimen and then loading pad was placed. The top part of membrane was rolled on to the loading pad. Then the stretcher was removed and ends were sealed with ‘O’ rings. With the properly sealed specimen placed centrally on the pedestal, the cell was assembled, keeping the loading piston initially clear of the loading pad of the specimen, the assembly was placed in the loading frame.

For unconsolidated undrained test, the bottom drainage value (BDV) and top drainage value (TDV) of cell, was closed and air release valve (ARV) was opened. The cell was filled with water through the cell water value CWV. ARV was closed when water begins to escape through it. The cell pressure was raised to the desired value and kept constant till the end of the test.

When the cell pressure was applied, the load piston rises upward, the loading machine was operated at the anticipated rate to bring the load piston slightly above the loading pad of the specimen and the load measuring dial gauge on proving ring was set to zero.

The piston was brought just in contact with loading pad by hand operation of the machine. The axial compression dial gauge was mounted and set to read zero.

The axial loading was started at 1.25 mm/min rate of strain. Simultaneous readings on the load and compression dial gauges were noted down. The test was continued until a recession of the axial load is observed or 20% of strain.

After failure, the specimen was unloaded by reversing the loading machine, cell pressure was reduced and cell water was drained out through BRV. The cell was dismantled and the specimen was taken out, rubber membrane was removed and weight of the failed sample and its water content was determined. The test was repeated on two more identical specimens with increasing cell pressure.

The rate of strain for conducting UUT is kept as 1.25 mm/min as per codal/literature provision based on strata.

5.1.10 Chemical Testing

Chemical Testing was generally performed in accordance with IS: 2720, but the different parts of method as described below:

a) Total Sulphate Content Of Soil

Samples were tested according to IS 2720 (Part 27). The dried soil was extracted with a 10% solution of hydrochloric acid. The extract was adjusted to slightly alkaline pH with ammonia, and then barium chloride solution was added to precipitate the sulphate. The barium sulphate precipitate was collected by filtration, and it was washed, dried and weighed. The mass of barium sulphate recovered was used to calculate the sulphate content of the original soil.

b) pH Value

Samples were tested according to IS: 2720 (Part 26). The soil sample (30 ± 0.1g) was extracted with 75 ml of distilled water and the pH of the resulting suspension was measured with a calibrated (by means of Standard buffer solution) pH meter.

c) Chloride Content

For the water soluble content, soil samples were extracted with a volume of water equal to twice the mass of the soil. The extract was filtered and acidified with a small amount of nitric acid. Standardized silver nitrate solution was then added to precipitate the chloride as its silver salt. The amount of precipitated silver remaining in solution was then determined by titration.

An acid-soluble version of the test was also available, with the initial extraction being with nitric acid instead of water.

CHAPTER 2 ANALYSIS OF TEST RESULTS AND INTERPRETATION

6.0 STRATIFICATION

From the study of the borehole carried out at New Ch. 0+000 to Old Ch. 10+859 (New Ch: 11+543) & Old Ch. 17+625 to Old Ch. 20+300 (New Ch: 18+310 to 20+985), it is revealed that the substrata of all boreholes mainly consisit of Silty Clay of low plasticity (CL), sandy silt of low plasticity (ML-CL), Silty Sand with Clay (SM-SC), Silty Sand (SM).

6.1 GROUND WATER TABLE DEPTH

The Ground Water Table was met at depths of from 0.29m to 24.90m below EGL as given in Table 1.1, it may rise up during heavy rains / rainy season. Therefore, for the analysis of various foundations, the water table has been considered to rise by about 2.0 to 3.0m at the locations of boreholes.

6.2 RESULTS OF CHEMICAL ANALYSIS

Results of chemical analysis of soil samples (as per **Appendix – B2**) indicates that the soil sample falls under Class I for sulphates and chlorides concentration (As per IS 456-2000 and CIRIA Sp. Publication No. 31). The results are summarized here in below :-

Summary of chemical analysis of soil samples

Chemical Property	Findings (Min. to Max.)	Remarks (Required limits as per IS 456-2000)
pH	6.54 to 9.51	> 6.0
Sulphite as SO_3^{2-} (%)	0.0015 (%) to 0.0033 (%)	< 0.2% (Class I)
Chlorides as Cl^- (%)	0.0067 (%) to 0.0093 (%)	No limit specified in IS 456. However, a limit of 0.10% specified for class I in CIRIA Sp. Publication No. 31)

Note :- All the chemical contents are within permissible limit hence no special precautions are required.

6.3 COMPUTATION OF LIQUEFACTION POTENTIAL

Liquefaction is the sudden loss of shear strength of the sub soil strata due to earthquake-induced vibration under saturated conditions.

Assessment of liquefaction potential of foundation strata is made by simplified approach proposed as per IS: 1893 (Part-1)-2016, from the SPT data and peak ground acceleration likely to occur at the site. In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake (DBE) is first evaluated.

Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Unsaturated soils are not subjected to liquefaction because vibratory forces from earthquakes do not cause any increase in pore water pressure in such soils.

The area of site from Palwal to Harsana Kalan (Sonipat) in the State of Haryana falls in seismic zone – IV of India as per IS: 1893. Further as per the provisions of IS: 1893 in soil deposits consisting of submerged loose sands & soils falling under classification of SP with standard penetration N value less than 15, the shaking caused by earthquake ground motion may cause liquefaction or excessive total and differential settlements.

For the analysis of liquefaction potential, following constant parameters are considered:

EQ Zone	IV
Earthquake Magnitude (Mw)	7.0
Peak Horizontal Ground Acceleration (amax /g)	0.24

The Ground Water Table was met at depths of from 0.29m to 24.90m below EGL as given in Table 1.1. For the analysis of liquefaction potential, the water table is generally considered to rise by about 3.0m at the location of all boreholes. The strata in the boreholes are not likely to liquefy as mentioned above and the same is tabulated below:-

Table 2.1: Liquefaction Analysis

6.4 INTERPRETATION OF LAB TEST RESULTS

Grain Size Analysis

1. **Clay content:** It generally varies from 4 to 11%.
2. **Silt content:** It generally varies from 20 to 66%.
3. **Sand content:** It generally varies from 22 to 85%.

4. **Gravel content:** It generally varies from 1 to 10%.

Atterberg's Limit

5. **Liquid limit:** The test results of liquid limit of the soil samples reveal that it generally varies from 24 to 28% in ML-CL type of soil, 32 to 33% in CL type of soil.
6. **Plastic Limit:** The plastic limit of the soil sample varies from 20 to 21% in ML-CL type of soil, 20 to 23% in CL type of soil. However ML-CL type of soil is considered as non-plastic.
7. **Plasticity index:** The plasticity index of the soil samples generally varies from 5 to 6% in ML-CL type of soil, 9 to 11% in CL type of soil whereas ML-CL and SM/ SM-SC/ SC type of soil are non-plastic.

Natural moisture content & Bulk density

The bulk density of soil samples generally varies from 1.84 gm/cc to 1.97gm/cc whereas natural moisture content varies from 10% to 21%.

Direct shear tests:

Direct shear test under drained condition have been conducted in sandy silty (ML-CL) / sandy stratum (SM/ SM-SC/ SC) type of soil.

For Sandy strata (SM/ SM-SC/ SC), the value of angle of internal friction varies from 28^o to 32^o, whereas cohesion varies from 0.00 kg/cm^2 to 0.11 kg/cm^2.

For Silty strata (ML-CL), the value of angle of internal friction varies from 24^o to 27^o, whereas cohesion varies from 0.11 kg/cm^2 to 0.22 kg/cm^2.

Triaxial shear tests:

Triaxial shear test under undrained condition have been conducted in silty clay (CL) type of soil.

For silty clay (CL) strata, the value of angle of internal friction varies from 4^o to 5^o, whereas cohesion varies from 1.41kg/cm^2 to 2.22 kg/cm^2.

FROM THE STUDY OF PRESSURE-SETTLEMENT CURVE (ON ARITHMETIC SCALE) OF 01 PLATE LOAD TESTS AS PROVIDED VIDE APPENDIX A-4, IT IS REVEALED THAT

<u>For PLT-09 New Ch-0+000</u>

1. Ultimate bearing capacity and Safe bearing capacity of the sandy soil with respect to plate is found to be 17.05 t/m^2 and 6.82 t/m^2, respectively.
2. Safe bearing capacity of soil for 2.70 m foundation depth is found to be 22.75 t/m^2 at 25 mm settlement. As per shear failure criteria (Bowles, J.E., 1982. Foundation design and analysis), it is found to be 20.4 t/m^2.

Note:

The Safe bearing capacity of sandy soil as per shear failure criteria is computed by the following given relation (Bowles, J.E., 1982. Foundation design and analysis),

$$q_{Safe} = q_{safe\ (Plate)}\ X \left(\frac{B_{Foundation}}{B_{Plate}}\right)$$

J.E., 1982 recommended that the above equation is valid when the ratio lies between 3 to 6. However for better understanding the ratio is conservatively restricted to 3. The use of this equation is not recommended unless the ratio is not much more than about 3. When the ratio is more than 6 to 15 or more the extrapolation from a plate load test is little more than a guess that could be obtained at least as reliably using an SPT or CPT corerection.

CHAPTER 3 TYPE AND DEPTH OF FOUNDATION WITH ANALYSIS

7.0 TYPE & DEPTH OF FOUNDATION:

Based on the nature & strength characteristics of the substrata and requirement of the project, the following type of foundation have been analyzed as given below:

Table 3.1 : Shallow Foundation

Type of foundation	Depth of Foundation below E.G.L. (m)	Size of Foundation (m x m)
Shallow Foundation	1.0, 2.0, 3.0	1.5 x 1.5
	1.0, 2.0, 2.7, 3.0	2.0 x 2.0
	1.0, 2.0, 3.0	2.7 x 2.7
	1.0, 2.0, 3.0	3.7 x 3.7
	1.0, 2.0, 3.0	4.8 x 4.8
	1.0, 2.0, 3.0	5.5 x 5.5
	1.0, 2.0, 3.0	6.0 x 6.0
	1.0, 2.0, 3.0	7.2 x 7.2
	1.0, 2.0, 3.0	12.5 x 12.5

Table 3.2 : Pile Foundation

Type of foundation	Length of Pile below E.G.L. (m)	Dia. of Pile (m)
Normal Bored Cast in-situ RCC Pile	14.0, 16.0, 18.0, 20.0, 22.0, 24.0, 26.0, 28.0, 30.0 & 32.0	1.0 & 1.2

The details of foundation analysis are given in the subsequent paragraph.

7.1 ANALYSIS OF SHALLOW FOUNDATION

7.1.1 From Shear Failure Criteria

Net Safe Bearing capacity from Shear Failure consideration has been computed in accordance with IS: 6403-1981, which is based on, modified Terzaghi's classical approach. The weighted average of shear strength parameters for various strata upto depth equal to 0.5*B*Tan (45+Ø/2) (where B = Width of the Foundation, Ø = Angle of internal friction) is used in the analysis. A factor of safety of 2.5 to estimate the net safe bearing capacity from ultimate net bearing capacity.

For soils, containing both coarse grained (gravels & sands) and fine grained (clays), c and Φ are used to determine the soil strength. In case of predominantly fine grained soils, c and Φ are determined by the Triaxial Compression test as per IS: 2720 pt XI. For predominantly coarse grained soils, c and Φ are determined by Direct Shear test as per IS: 2720 pt XIII. These c and Φ values were used for determining the SBC of soil as per shear failure criteria.

The ultimate net bearing capacity in case of general shear failure is given by following expression,

$q_d = c\, N_c\, s_c\, d_c\, i_c + q\,(N_q-1)\, s_q\, d_q\, i_q + (1/2)\, B\, \gamma\, N_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$

The ultimate net bearing capacity in case of local shear failure is given by following expression,

$q'_d = (2/3)\, c\, N'_c\, s_c\, d_c\, i_c + q\,(N'_q-1)\, s_q\, d_q\, i_q + (1/2)\, B\, \gamma\, N'_\gamma\, s_\gamma\, d_\gamma\, i_\gamma\, W'$

Where,

$d_c = 1+ 0.2\,(D_f/B)*SQRT(N_\phi)$

$d_q = d_\gamma = 1$ for $\phi < 10^o$

$d_q = d_\gamma = 1 + 0.1\,(D_f/B)*SQRT(N_\phi)$ for $\phi > 10^o$

$N_\phi = \tan^2(\pi/4 + \phi/2)$

ϕ' for local shear failure = $\tan^{-1}(0.67 \tan\phi)$

7.1.2 From Settlement Failure Criteria

Allowable Bearing Pressure from Settlement Failure consideration has been computed in accordance with IS: 8009 (Part-I). The magnitude of settlement, when foundation loads are applied, depends upon the compressibility of the underlying strata and rigidity of the substructure.

The total permissible settlement in cohesion-less soil is estimated using SPT value as per IS: 8009 (Part-I). While using this approach, the N value was corrected, wherever applicable, below the footing base to at least 1.5B below the base to account for the effects of energy ratio, adopted bearing pressure, dilation for submerged silty fine sands / fine sands as well as that due to the overburden pressure.

Further for settlement Calculation in cohesive soil the following equation has been used.

$S_t = \Delta P\, M_v\, H$

Where,

M_v = Coefficient of volume compressibility, cm^2/kg

ΔP = Pressure increment, kg/cm^2

H = Thickness of layers

Note: - Value of Coefficient of volume compressibility (Mv) has been calculated by using the following co-relation [Ref. Stroud and Butler, 1975] :-

Coefficient of Volume Compressibility derived from SPT N-Value (after Stroud and Butler, 1975)

Plasticity Index (%)	Conversion Factor (f_2)	m_v (10^{-3} kPa^{-1}) based on N-Value: $m_v = 1/(f_2 N)$				
		N=10	N=20	N=30	N=40	N=50
10	800	0.12	0.06	0.04	0.03	0.02
20	525	0.19	0.09	0.06	0.05	0.04

Plasticity Index (%)	**Conversion Factor (f_2)**	**m_v (10^{-3} kPa^{-1}) based on N-Value: $m_v = 1/(f_2N)$**				
		N=10	**N=20**	**N=30**	**N=40**	**N=50**
30	475	0.21	0.10	0.07	0.05	0.04
40	450	0.22	0.11	0.07	0.06	0.04

$Mv = 1/(f_2N_{corr.})$

Where f_2 = factor based on $N_{corr.}$ Value & plasticity index of soil

$N_{corr.}$ = corrected SPT 'N' value

For analysis of shallow foundation the total permissible settlement has been considered as 25mm, & 50mm as per IS 1904.

Zone of influence below foundation has been considered up to 1.5 times the width of the foundation.

For the determination of the SBC from settlement criteria, the corrected SPT N values within the influence zone are given in the table below.

NOTE:-

- Lower of the two values obtained from settlement and shear criteria is used in arriving at allowable bearing capacity of the soil.
- Structural foundations are designed based on the minimum of Safe Bearing Capacity obtained from Shear Failure Criteria and Allowable Bearing Pressure corresponding to the permissible settlement. The permissible Settlement that can be allowed for the foundation depends on the strata at the location and type of foundation (whether Isolated or Raft).

Settlement occurs with the application of loads on foundations. It has two components, Immediate Settlement and Long Term Settlement. The immediate settlement takes place immediately as the loading is imposed on the structure and long term settlement arises due to the consolidation of the sub-soil with time under the load. Hence, the total settlement allowed for a foundation is the sum of the immediate and consolidation settlement that is expected to occur. The cohesionless strata (predominantly sandy) is primarily subjected to immediate settlement and cohesive strata (clayey) undergoes settlement in long time with the compression of the strata due to consolidation. Settlement of the foundation is determined from the relation provided in Indian standards (IS: 8009 (part-1) &/or various literatures (Bowles, BM Das, etc.).

From the Geotechnical investigation conducted on our site along with subsequent laboratory tests on soil samples, it is observed that predominantly the strata is silty with sand (SM/SC/SM-SC/ML-CL i.e. predominantly cohesionless) with the presence of small patches of silty clay of low plasticity (CL). Since the Settlement that takes place in cohesionless strata is mostly immediate, it takes place immediately after the imposing of load, initially during construction with the application of Dead Load and further during Live Load. The live load usually is many times lesser than the dead load, and correspondingly the post construction settlement is very less for live loads. As an example, if dead load is three times that of live load, then the settlement corresponding to live load (i.e. the post construction settlement) will be one-third of the settlement due to dead load which is comparatively lesser than 25mm for permissible settlement of 50mm.

According to the IS 1904, the permissible settlement for concrete structure having raft foundation is allowed upto 75mm, and the permissible settlement is 25mm post construction as per IRS code (Code of Practice for The Design of Sub-Structures and Foundations of Bridges). As discussed above, the settlement post construction is directly proportional to the allowable settlement. Therefore, given the importance of structure to be constructed and considering mostly cohesionless strata encountered at site, it is recommended that the maximum permissible settlement shall be restricted to 50mm for the design purpose on conservative side so that the post construction settlement can be constraint to lesser than 25mm.

As per IS- 8009 part 1 clause 9.2.2.1, If the clay layer is sandwitched between cohesionless soil layers, the immediate settlement is zero. Hence, even though the immediate settlement has been calculated during analysis, however it is ignored in the calculation of total settlement.

The sample calculations for computation of allowable bearing capacity of sub-strata for shallow foundation vide **Appendix – C-2.**

7.2 ANALYSIS OF PILE FOUNDATION

(A) DEEP FOUNDATION

The safe Load Carrying Capacity of normal bored cast in-situ RCC pile is determined in compression, uplift and lateral as per IS: 2911 (Part-1/sec-2) – 2010. The axial capacity of a pile depends upon the soil skin friction along the shaft and end bearing at it's tip.

Thus Axial load = Skin Friction + End-bearing

a) For piles in granular soils (using the static formula)

$$\mathbf{Q_u = (0.5*D*\gamma*N_\gamma + P_D*N_q)*A_p + (\Sigma K_i*P_{Di}*\tan\delta_i)*A_{si}}$$

Where,

Q_u = Ultimate load capacity of pile in KN

D = dia. of pile shaft in m

γ = effective unit weight of the soil at pile tip in kN/m^3

N_γ & N_q = bearing capacity factors depending upon the angle of internal friction Φ at pile tip (N_γ from IS 6403 for general shear failure case & N_q from Fig. 1, IS 2911)

P_D = effective overburden pressure at pile tip in kN/m^2 limited to 15-17 times diameter of pile (as per the Phi value at end bearing)

Σ = Summation for layers (1 to n) in which pile is installed and which contribute to (+ve) skin friction

K_i = coefficient of earth pressure applicable for the i^{th} layer

P_{Di} = effective overburden pressure for the i^{th} layer in kN/m^2 limited to 15-17 times diameter of pile (as per the Phi value at end bearing)

δ_i = angle of wall friction between pile and soil for i^{th} layer, and

A_{si} = surface area of pile shaft in the i^{th} layer in m^2

b) For piles in cohesive soils (using the static formula)

$$\mathbf{Q_u = cp*Nc*A_p + \Sigma\alpha_i*c_i*A_{si}}$$

Where,

Q_u = Ultimate load capacity of pile in KN

A_p = cross-sectional area of pile tip in m^2

N_c = bearing capacity factor (= 9)

Σ = Summation for layers (1 to n) in which pile is installed and which contribute to (+ve) skin friction

α_i = adhesion factor for the i^{th} layer depending on the consistency of soil

c_i = average cohesion for i^{th} layer in kN/m^2

A_{si} = surface area for pile shaft in the i^{th} layer in m^2

c) For computation of safe load carrying capacity of pile in lateral, the following equation has been used:

i. **<u>Fixed Head Condition</u>**

$$\mathbf{Q = (12 * E * I * Y) / (L_1 + L_f)^3}$$

ii. **<u>Free Head Condition</u>**

$$\mathbf{Q = (3 * E * I * Y) / (L_1 + L_f)^3}$$

Where,

Q = Lateral Load (in kg)

Y = Permissible lateral deflection taken as 5mm

E = Modulus of Elasticity of concrete

I = Moment of Inertia of the pile cross-section

L_1 = Length of pile above cut-off level

L_f = Length of fixity

The effective length of the pile has been considered below the cut-off level taken as 2.0m below the EGL. Normal Bored cast in-situ RCC piles having stem diameter equal to 100cm & 120cm and of effective length varying from 16.0m to 32.0m were selected.

For the analysis of the pile foundations the soil parameters used for computation of safe load carrying capacity of pile is tabulated below:-

Table 3.3 : Design Soil Parameter

ChainageOld (km)	ChainageNew (km)	BH.No.	Layer depth below EGL(m)		Thicknessofstrata(m)	Stratadescription	SPT'N'		BulkDensity(gm/cc)	Cohesion(C)(kg/cm^2)	Angle of internal Friction (Φ) (°)

Design parameter have been obtain from the laboratory test results however various depth where the shear parameter seems on the lower side with respect to SPT 'N' values those shear parameter have been judicially improved based on the SPT 'N' for the analysis purpose.

The sample calculation for computation of safe load carrying capacity of normal bored cast-in-situ RCC pile in compression & uplift are attached vide **Appendix C-3.**

The sample calculation for computation of safe load carrying capacity of normal bored cast-in-situ RCC pile in lateral are attached vide **Appendix C-4.**

CHAPTER 4 FOUNDATION RECOMMENDATIONS

8.0 FOUNDATION RECOMMENDATIONS

- Based on the nature & strength characteristics of the substrata and requirement of the project, shallow foundation and normal bored cast in-situ RCC pile foundation have been analyzed.
- Based on the method of analysis & design parameters given under Para 7.1 above, the recommended net allowable bearing capacity values are given in Table 4.1 to 4.4.

Table 4.1: Recommended Net Allowable Bearing Capacity for shallow foundation for allowable settlement 25mm

Chainage Old (km)	Chainage New (km)	BH. No.	Foundation Size (m x m)	Depth of foundation below EGL (m)	Net Safe Bearing Capacity from Shear Failure (t/m^2)	Net Allowable Bearing Pressure from settlement failure (t/m^2)	Recommended Net Allowable Bearing Capacity (t/m^2)

* The maximum value of recommended net allowable bearing capacity shall be restricted to 30 t/m^2.

Note:-

- NR* - BH's as Liquefible depth less than or equal to 4m (SBC is recommended after replacement/compaction).
- NR - BH's as Liquefible depth more than 4m. (Suitable ground improvement methods are recommended.

* The maximum value of recommended net allowable bearing capacity shall be restricted to 30 t/m^2.

Note:-

- NR* - BH's as Liquefible depth less than or equal to 4m (SBC is recommended after replacement/compaction).
- NR - BH's as Liquefible depth more than 4m. (Suitable ground improvement methods are recommended.

			7.2 x 7.2	4.0	21.5	29.3	21.5

Note:- Table 4.1& 4.2 Show that most of the boreholes are liquefiable up to certain depth. Therefore before laying the open foundation it is recommended to replace & compact the soil up to liquefaction depth, Replaced/ Compacted SBC are presented in Table 4.3 & 4.4. For the strata liquefying for more than 4m depth from EGL, Ground Improvement Techniques such as Dynamic Compaction or Vibro Compaction are recommended.

Note:-

- The maximum value of recommended net allowable bearing capacity shall be restricted to 30 t/m^2.
- As per the Morth guidelines the gradation of fill soil shall be as per following limits. The effective angle of friction not less than 30º. The gradation of fill soil shall be as per following limits.

Sieve Size	Percentage Passing
75 mm	100%
425 micron	0-60%
75 micron	less than 15 %
PI	≤6

1. *The density of backfill soil should be more than 95% of proctor density. The replaced /compacted soil should be lay down layer wise for each 300mm.*
2. *The design parameters considered for replaced/compacted Soil for calculating the SBC from shear criteria are as follows;*

C=0, Phi = 32 degree, Sp. Gravity= 2.63 Moisture content= 8%, bulk density= 1.84 g/cc, N = 25.

- Based on the method of analysis given under Para 7.2 above, The values of Safe Load Carrying Capacity of piles in compression, uplift and lateral under static conditions have been tabulated below:-

Table 4.5: Safe Load Carrying Capacity of normal bored cast in-situ RCC Pile in Soil

Chainage Old (km)	Chainage New (km)	BH. No.	Diameter of Pile (m)	Length of piles below cut-off (m)	Cut-off level below EGL (m)	Safe load carrying capacity of single pile (T)

Notes : -

1. Permissible lateral deflection has been taken as 5 mm.
2. The self weight of the pile has been taken into account while computing the Safe Load Carrying Capacity of Pile in uplift only and not considered for vertical load capacity in compression.
3. The safe load carrying capacity of piles have been worked out on the basis of IS: 2911 (Part-1/sec-2) – 2010 as per provisions / assumptions provided therein & are only an assessment based on characteristics of the sub-strata obtained at the locations of the above BHs. The safe load carrying capacities as tabulated above will further depend substantially on the piling technique adopted and equipment used for making the piles in the field. However, for the final designs & constructions, the safe/allowable load carrying capacities of these piles should be taken by conducting actual initial load tests on these piles by casting them in the respective areas.
4. While erecting normal bored cast in-situ pile, utmost care should be taken while flushing/cleaning the bottom of pile particularly prior to start of pouring of concrete so as o rest

the pile in virgin soil only for obtaining full point bearing as while computing safe load carrying capacity of pile no bottom softening during erection of pile has been considered.

5. Further the pile should have necessary structural strength to transmit / sustain the design load.

All The above recommendations are based on the field and laboratory tests conducted on selected soil/ rock core samples and our experience in this regard. If the actual substrata conditions during excavation for the foundation differ from the observations reported here, the design experts/consultants should be referred for suggestion, further investigations.

SYMBOL	DESCRIPTION
	SM- Silty Sand (Having fines Less Than 50% and no plasticity or below A-line)
	SM-SC -Clayey Sand (Having fines Less Than 50% and in the hatched zone (4<PI<7)
	ML-CL -Sandy with clay (Having fines greater than 50% and in the hatched zone (LL<35 & 4<PI<7)
	CL-Silty Clay of low plasticity (Above A-line, LL<35)
	CI- Clay of medium plasticity (Above A-line, 35≤LL<50) — LIQUEFACTION
	BOREHOLE REQUIRED — WATER TABLE

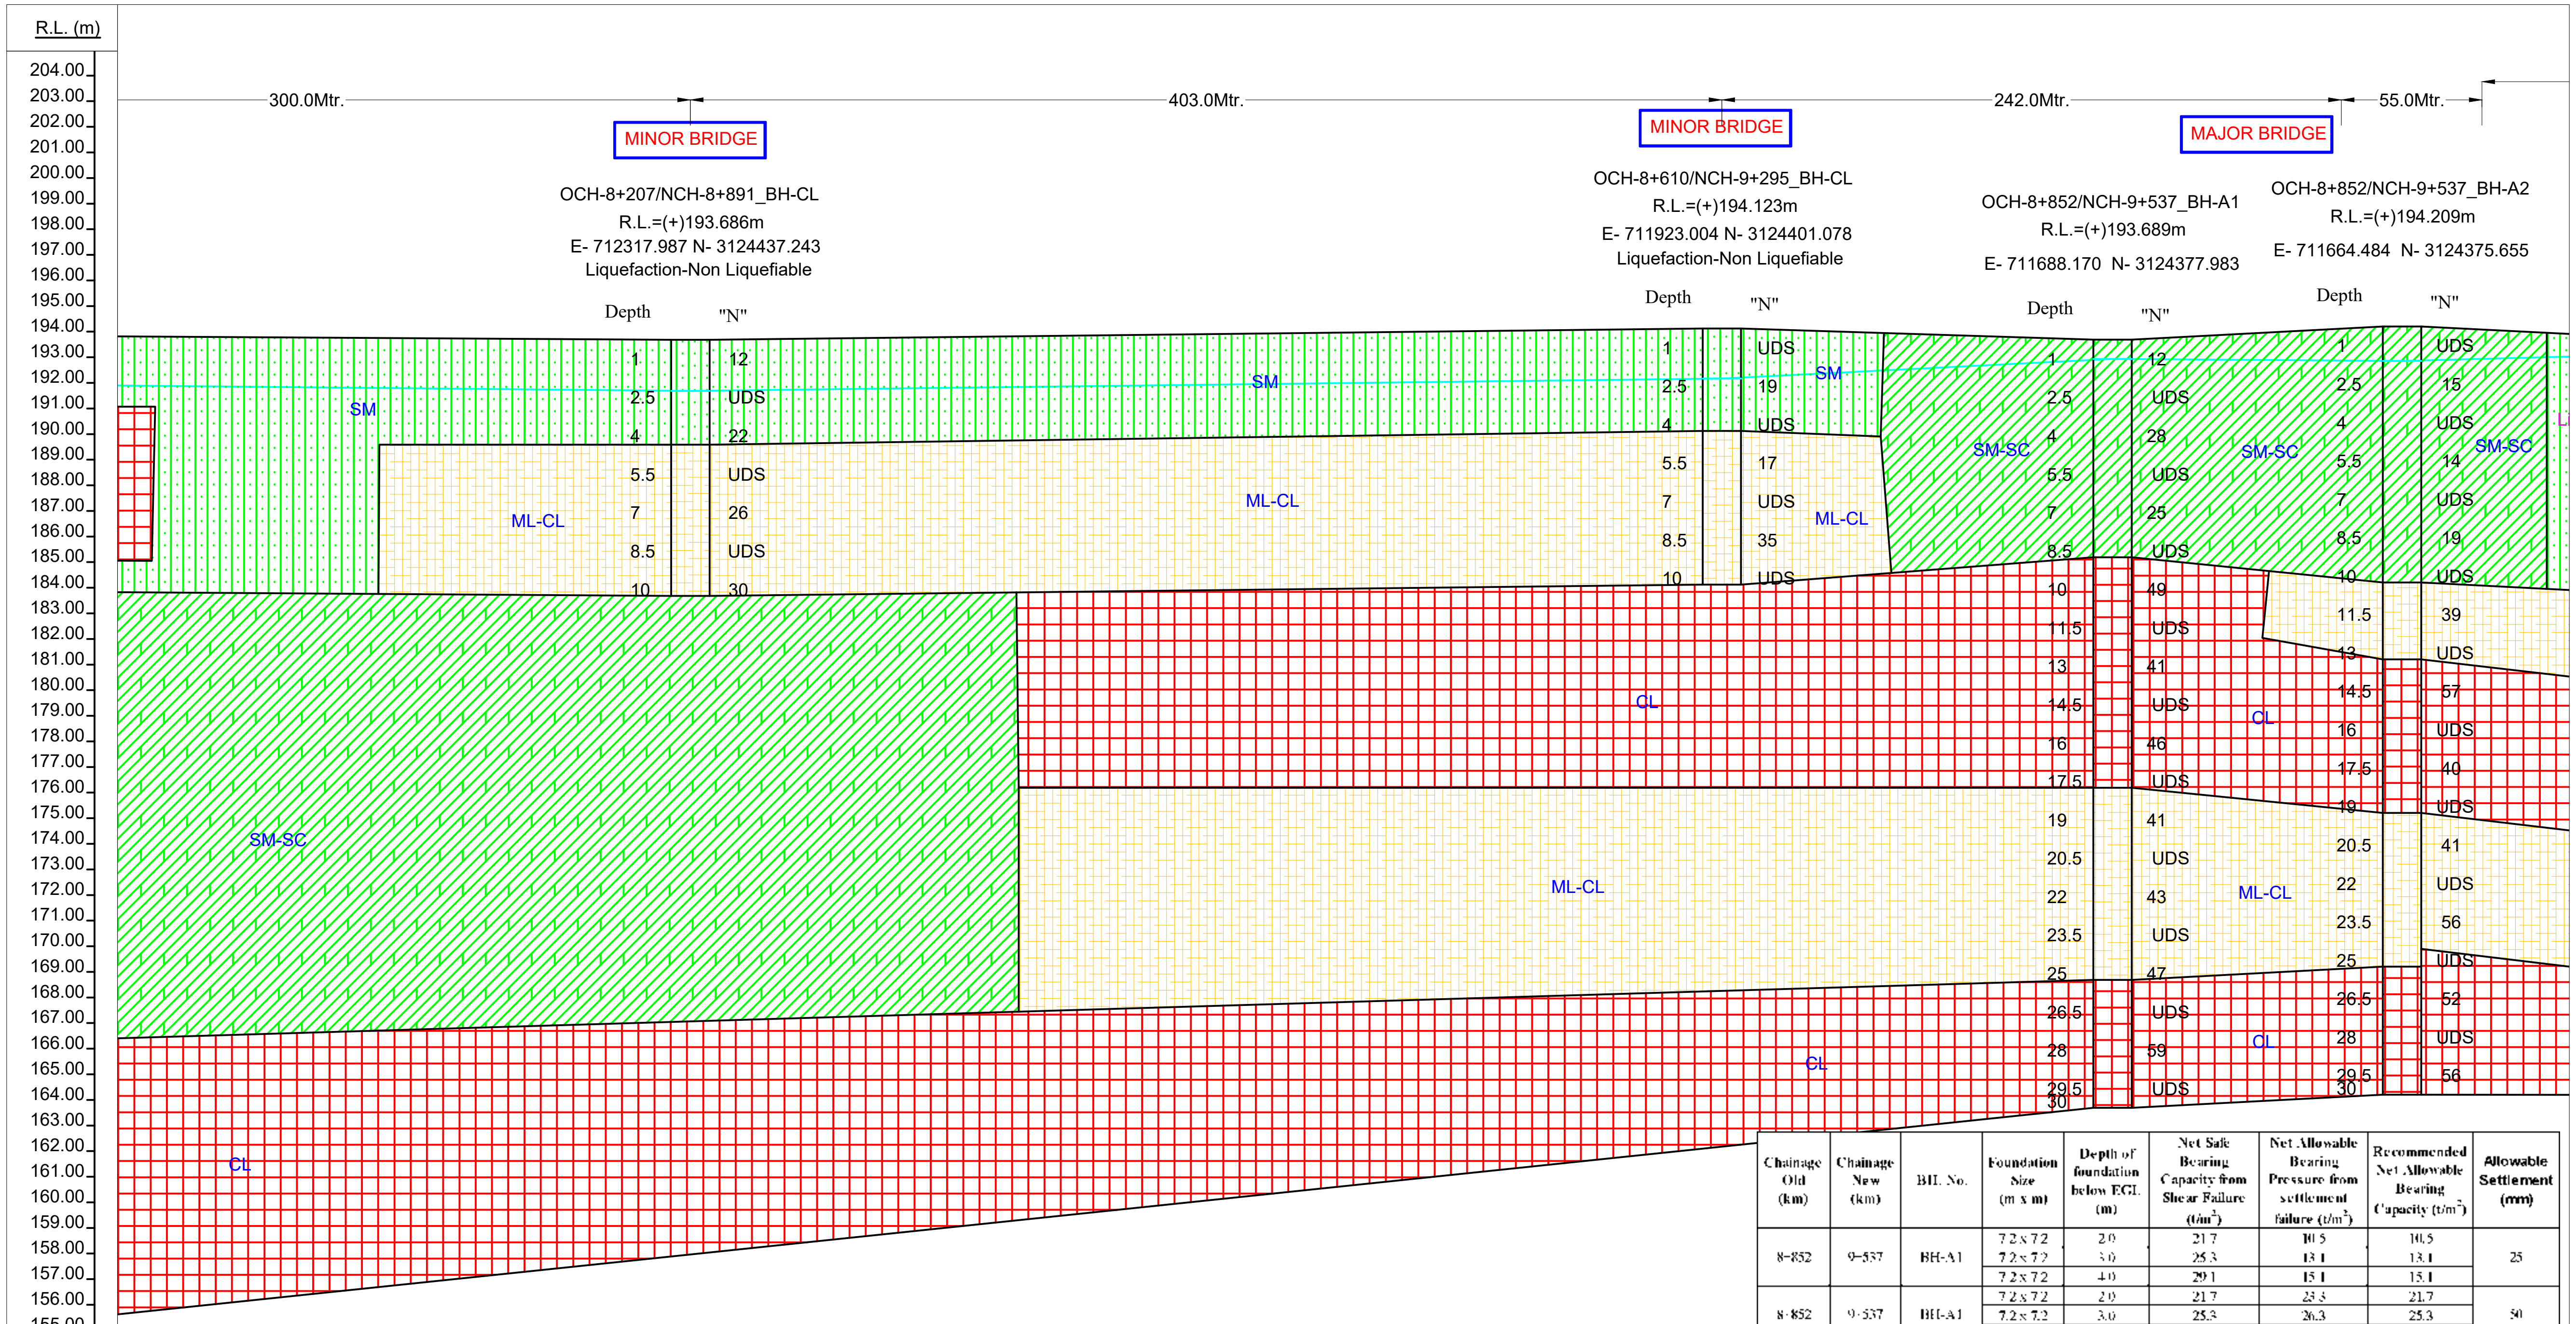
Note:- Fines= Percentage of Silty + Clay A-line=.73(wl-20) SCALE:- HOR:- 1:2850 SCALE:- VER:- 1:285

CONDUCTING GEOTECHNICAL INVESTIGATION, PREPARATION OF GEOTECHNICAL REPORT FOR DESIGNING OF BRIDGES AND FOR EMBANKMENT IN CONNECTION WITH CONSTRUCTION OF HARYANA ORBITAL RAIL CORRIDOR (HORC) PROJECT FROM PALWAL TO HARSANA KALAN INCLUDING CONNECTIVITY TO EXISTING IR NETWORK IN THE STATE OF HARYANA.



Note:-

NR - BH's as Liquefible depth more than 4m. (Suitable ground improvement methods are recommended.

SOIL CHARACTERISTICS

Project	Conducting geotechnical investigation, preparation of geotechnical report for designing of bridges and for embankment in connection with construction of Haryana Orbital Rail Corridor (HORC) project from Palwal to Harsana Kalan including connectivity to existing IR network in the state of Haryana.
Date of Boring	20-10-2021 to 22-10-2021
Chainage (km.)/Location	3+497 Major Bridge
B.H. No.	BH-P3
Depth of Water Table	15.31 m
Termination Depth	40.00 m
Cordinates (E,N)	716972.661 m, 3124891.431 m
R.L.	(+)195.759 m
Ref. Code	SR-544_21-22
