National Accreditation Board for
Testing and Calibration Laboratories

NABL

CERTIFICATE OF ACCREDITATION

TECHPRO ENGINEERS PVT. LTD. (LABORATORY DIVISION)

has been assessed and accredited in accordance with the standard

ISO/IEC 17025:2017

"General Requirements for the Competence of Testing & Calibration Laboratories"

for its facilities at

114, RAM GANGA HOUSING SOCIETY, NARAMAU, G.T. ROAD, KANPUR, UTTAR PRADESH, INDIA

in the field of

TESTING

Certificate Number: TC-9169

Issue Date: 23/12/2022 Valid Until: 22/12/2024

This certificate remains valid for the Scope of Accreditation as specified in the annexure subject to continued satisfactory compliance to the above standard & the relevant requirements of NABL.
(To see the scope of accreditation of this laboratory, you may also visit NABL website www.nabl-india.org)

Name of Legal Identity : Techpro Engineers Private Limited

ACKNOWLEDGEMENTS

We are pleased to submit the part-5 of the report of Geotechnical investigation, conducted for the boreholes P81 to P100 for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)
B.Tech. (Civil), M.Tech.
Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -5 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers P81 to P100.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15' N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

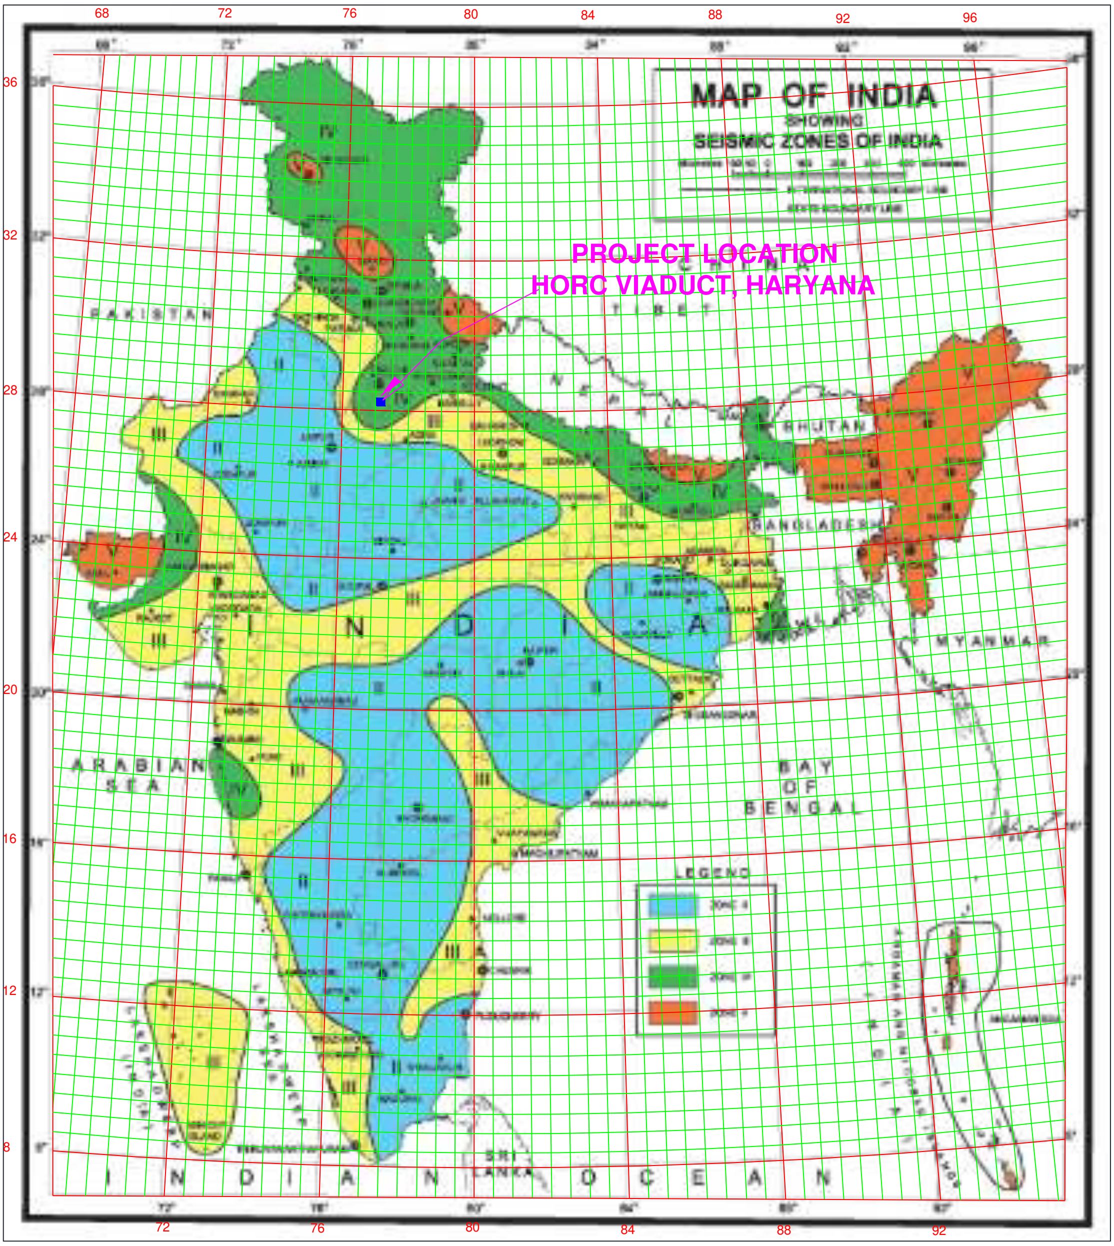

Fig.1: Seismic Zone Map of India

4. FIELD INVES TIGATION:

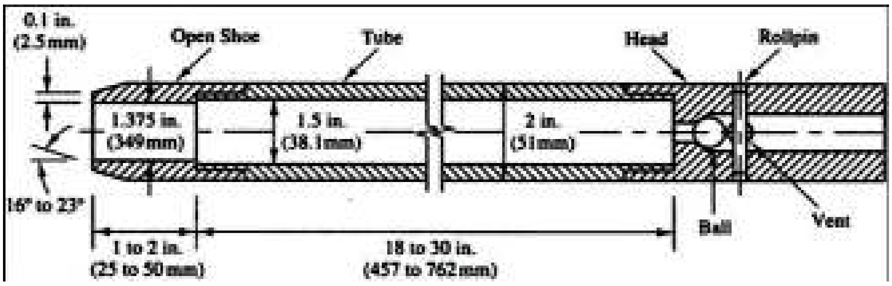
The field investigation work at this site was carried out from Oct 5th; 2023 to Oct 12th; 2023 and Oct 21st; 2023 to Oct 30th; 2023. The following investigation

work was carried out:

4.1. **Twenty number** of **boreholes** (marked as P81 to P100) of diameter 150 mm in soil were made within the proposed alignment for conducting Standard Penetration Test and collection of disturbed and undisturbed samples. The boreholes were progressed using power operated winch machine under **percussion** method of drilling. Casing was used to keep the borehole stable. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in “TEST LOCATION PLAN” in Appendix A.

4.2. **Standard Penetration Tests** were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **auto-trip hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is termed the penetration resistance N. The N’ values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		**Correlation For Sand/Non-Plastic Silt**	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 50 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77x \log (2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 to 20 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. Disturbed soil samples were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 to 20 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. Undisturbed soil samples were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness of not less than 25 mm. The laboratory test results have been reported in Table 1 to 20 of Appendix-B.

4.5. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.6. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.5. **Atterbergs' limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) -1980-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.7. Consolidation tests were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.8. Direct shear tests were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.9. Tri-axial Compression Test under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.10. Unconfined Compressive strength tests were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 21 of Appendix B

5.11. Shrinkage Limit tests were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

5.12. Free Swell Index were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 to 20: "SUMMARY OF TEST RESULTS" of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced Level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS: 13365-1. The detailed nature of the strata has been reported in Table 1 to 20: “SUMMARY OF TEST RESULTS” of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in all the bore hole, is predominantly comprising of inorganic silty clays of low plasticity and inorganic silts of non to low plastic category. Silty sands were encountered at variable depth and thickness in most of the boreholes. Inorganic silts of intermediate plasticity were also found at some depths and thickness in some of the boreholes.

8. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation **(Bored Cast-In-Situ RCC piles)** have been considered for computation of load bearing capacity of the underlying soil strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020) with due consideration of effects of liquefaction.

8.1. Design Parameters:

Factor of safety in compression	=	2.50
Factor of safety in tension	=	3.00
Depth of critical water table	=	0.00 m
Diameter of pile	=	1.00 & 1.20 m
Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

8.2. Computation of friction along pile stem:

$Q_{uf} = \sum K_i . P_{di} . \tan\delta_i . A_{si}$

where,

Q_{uf} = Ultimate shaft friction (kN/m^2)

K_i = Coefficient of earth pressure at mid-depth of ith layer

P_{di} = Effective overburden pressure at mid-depth of ith layer (kN/m^2)

A_{si} = Surface area of pile stem in ith layer (m^2)

δ_i = Angle of wall friction between pile and soil of ith layer (= ϕ) (degree)

ϕ_i = Angle of internal friction of soil in ith layer (degree)

$\sum$ = Sum of all layers up to ith layer

8.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \sum \alpha_i . c_i . A_{si}$

Where,

c_i = Cohesion in ith layer

A_{si} = Surface area of pile stem in i^{th} layer (m^2)

α_i = Adhesion factor for i^{th} layer of soil depending of consistency of soils

$\sum$ = Sum of cohesion of all layers considered

8.4. Computation of end bearing resistance:

$Q_{ub} = A_p\,(c.Nc + q.Nq + 0.5.\,\gamma.B.N\gamma)$

Where,

A_p = Area of the pile toe (m^2)

c = cohesion of soils at pile toe (kN/m^2)

γ = Effective Unit weight of soils at pile toe (kN/m^3)

B = Diameter of pile (m)

q = Effective overburden pressure at pile toe (kN/m^2)

N_c = Bearing Capacity Factor (Recommended equal to 9)

Nq, Nγ = Bearing Capacity Factor

8.5. Lateral load capacity of piles in soils:

$Q_u = 12.E.I.\delta/(L_1+L_f)^3$

where,

Q_u = Ultimate lateral load capacity of pile (kN)

δ = Permissible deflection (m) = 5 mm

E = Young Modulus of pile material (kN/m^2)

I = Moment of Inertia of the pile cross section (m^4)

L_1 = Cantilever Length of pile (m)

L_f = Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-1 to 2** of **Appendix-H.**

Pile lateral Load capacity has been given in **Table-3 to 4** of **Appendix-H**.

9. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (energy efficiency factor)

Design Earthquake Base:

Earthquake zone = IV

Magnitude of earthquake = 7

Seismic Zone factor = 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

< 1.00 : Stratum is to be considered as liquefiable

> 1.20 : Non-Liquefiable

The detailed calculations of liquefaction, have been reported in **Table-5** of **Appendix-H.**

10. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

10.1. **Bored Cast-In-Situ RCC Piles** of diameter 1000 and 1200 mm have been adopted for SBC computations of foundation for Viaduct.

10.2. **Cut off length** of piles have been considered as 2.50 m from the existing ground level for the purpose of computation of SBC.

10.3. **Pile length** recommended in the table below, shall be measured **after the cut-off depth.**

10.4. **Allowable load carrying capacity** of pile corresponding to the length and diameter of pile shall be read from the tables below:

10.4.1. For Pile diameter = 1000 mm

Borehole No.	Pile Length (m)	Load carrying Capacity (kN)		
		Compression	Uplift	Lateral Concrete M35*
P81	25.00	2200	1700	65

10.5. Liquefaction Potential: All the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. Out of which several boreholes show the potential at various depths mentioned in the table below:

Bore No.	Liquefiable depth zone (meter)
P81	Top 4.00 & 5.00 to 6.00
P82	Top 1.00 & 7.00 to 8.00
P83	Top 6.00 & 7.00 to 9.00
P84	Top 1.00
P85	1.00 to 2.00 & 6.00 to 8.00
P86	3.00 to 6.00
P87	3.00 to 8.00
P88	Top 1.00 & 3.00 to 4.00
P89	Top 1.00 ,3.00 to 7.00 & 8.00 to 9.00
P90	Top 1.00 & 3.00 to 5.00
P91	Top 1.00 & 3.00 to 7.00
P92	Top 1.00 & 3.00 to 7.00
P93	Top 4.00
P94	Top 1.00 & 5.00 to 6.00
P95	2.00 to 5.00 & 7.00 to 8.00
P96	Top 1.00, 2.00 to 4.00 & 6.00 to 8.00
P97	3.00 to 6.00 & 7.00 to 8.00
P98	Top 5.00 & 6.00 to 7.00
P99	1.00 to 3.00
P100	1.00 to 3.00 & 5.00 to 6.00

ACKNOWLEDGEMENTS

We are pleased to submit the part-6 of the report of Geotechnical investigation, conducted for the boreholes P101 to P113 for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)
B.Tech. (Civil), M.Tech.
Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -6 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers P101 to P113.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15’ N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

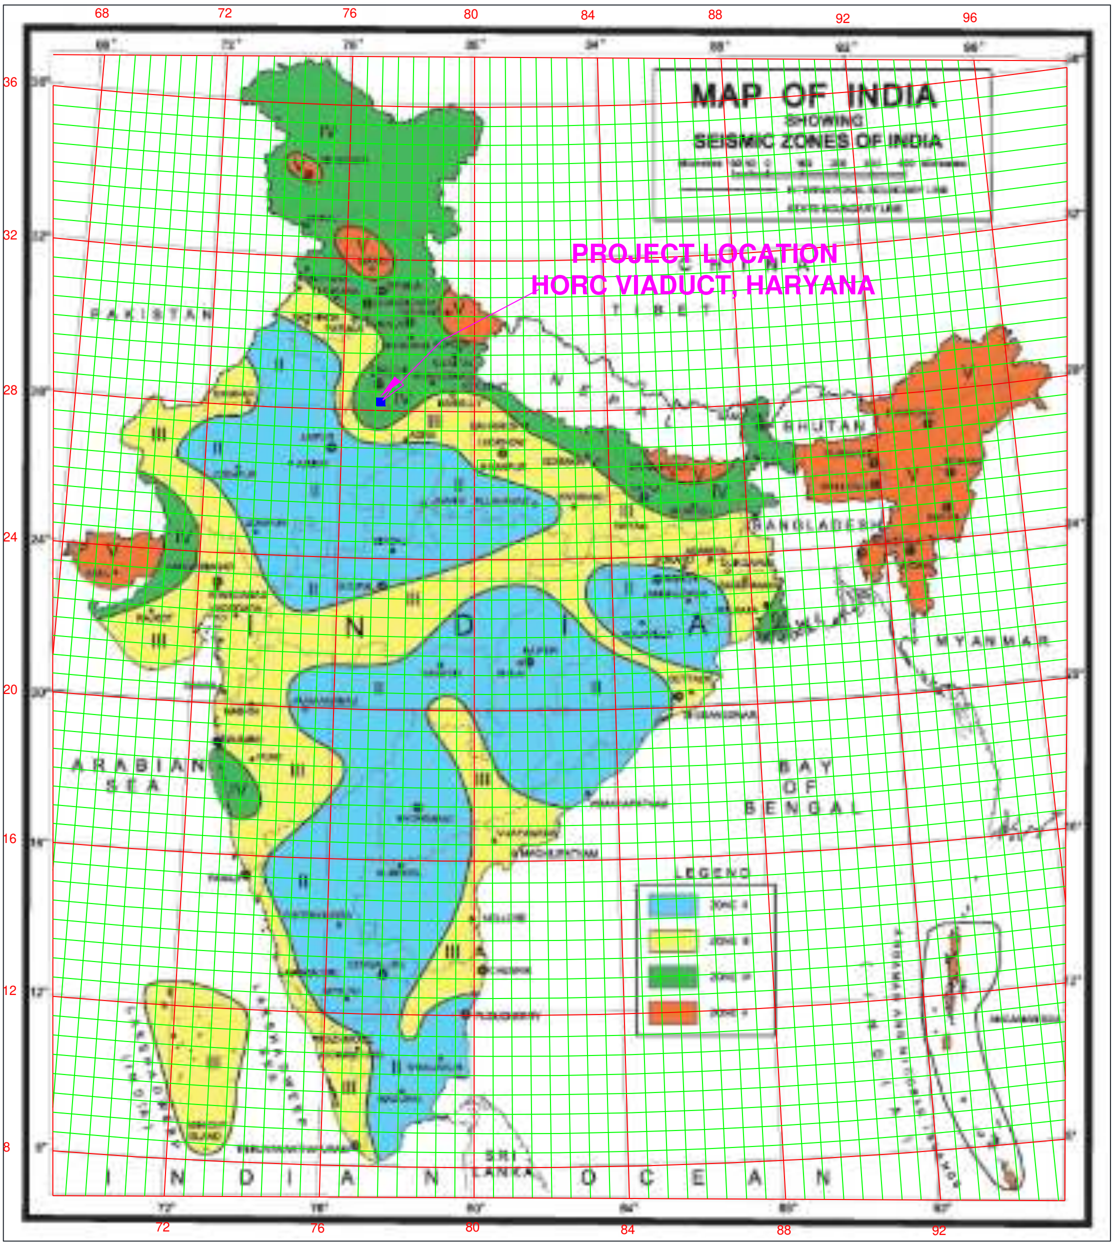

Fig.1: Seismic Zone Map of India

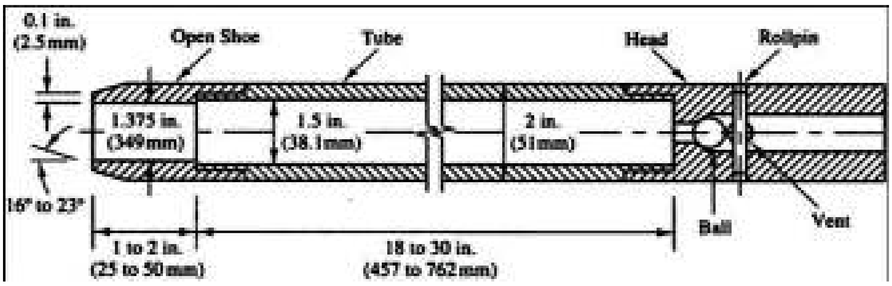
4. FIELD INVESTIGATION:

The field investigation work at this site was carried out from Oct 11th; 2023 to Nov 2nd; 2023. The following investigation work was carried out:

4.1. Seven number of **boreholes** (marked as P101, P102, P103, P104, P105, P106, P111) of diameter 150 mm in soil were made within the proposed alignment for conducting Standard Penetration Test and collection of disturbed and undisturbed samples. The boreholes were progressed using power operated winch and hydraulic rig machine under percussion and rotary method of drilling respectively. Casing was used to keep the borehole stable. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in “TEST LOCATION PLAN” in Appendix A.

4.2. Standard Penetration Tests were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **auto-trip & rope-pulley driven hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is termed the penetration resistance N. The N’ values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		Correlation For Sand/Non-Plastic Silt	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 50 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77x \log (2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 to 7 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. **Disturbed soil samples** were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 to 7 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. **Undisturbed soil samples** were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness of not less than 25 mm. The laboratory test results have been reported in Table 1 to 7 of Appendix-B.

4.5. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.6. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.5. **Atterbergs' limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) -1980-(RA: 2021) and the results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.7. Consolidation tests were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.8. Direct shear tests were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.9. Tri-axial Compression Test under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.10. Unconfined Compressive strength tests were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 8 of Appendix B.

5.11. Shrinkage Limit tests were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

5.12. Free Swell Index were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced Level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P101	23562.087	700986.455	3120498.173	193.949	40.00	1.30
P102	23588.287	700986.810	3120524.371	194.023	40.00	1.00
P103	23614.487	700987.165	3120550.568	194.050	40.00	0.50
P104	23640.687	700987.521	3120576.766	194.067	40.00	1.20

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced Level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P105	23666.887	700987.876	3120602.953	193.916	40.00	1.30
P106	23693.087	700988.231	3120629.123	194.696	40.00	0.60
P111	23830.447	700989.842	3120766.590	194.745	40.00	1.30

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS: 13365-1. The detailed nature of the strata has been reported in Table 1 to 7: "SUMMARY OF TEST RESULTS" of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in all the bore hole, is predominantly comprising of inorganic silty clays of low plasticity and inorganic silts of non to low plastic category. Silty sands and silty sands containing clay binders were also encountered at variable depths and thickness. Inorganic silty clays of intermediate plastic category was found as exception in borehole P101 at the depth of 22.00 to 25.00 meters and in borehole P105 at the depth of 12.00 to 13.00 meters.

8. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation **(Bored Cast-In-Situ RCC piles)** have been considered for computation of load bearing capacity of the underlying soil strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020) with due consideration of effects of liquefaction.

8.1. Design Parameters:

Factor of safety in compression = 2.50

Factor of safety in tension = 3.00

Depth of critical water table = 0.00 m

Diameter of pile = 1.00 & 1.20 m

Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

8.2. Computation of friction along pile stem:

$Q_{uf} = \sum K_i.P_{di}.\tan\delta_i.A_{si}$

where,

Q_{uf}	=	Ultimate shaft friction (kN/m^2)
K_i	=	Coefficient of earth pressure at mid-depth of ith layer
P_{di}	=	Effective overburden pressure at mid-depth of ith layer (kN/m^2)
A_{si}	=	Surface area of pile stem in ith layer (m^2)
δ_i	=	Angle of wall friction between pile and soil of ith layer (= ϕ) (degree)
ϕ_i	=	Angle of internal friction of soil in ith layer (degree)
$\sum$	=	Sum of all layers up to ith layer

8.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \sum \alpha_i.c_i.A_{si}$

Where,

c_i	=	Cohesion in ith layer
A_{si}	=	Surface area of pile stem in ith layer (m^2)
α_i	=	Adhesion factor for ith layer of soil depending of consistency of soils
$\sum$	=	Sum of cohesion of all layers considered

8.4. Computation of end bearing resistance:

$Q_{ub} = A_p\,(c.N_c + q.N_q + 0.5.\gamma.B.N_\gamma)$

Where,

A_p	=	Area of the pile toe (m^2)
c	=	cohesion of soils at pile toe (kN/m^2)
γ	=	Effective Unit weight of soils at pile toe (kN/m^3)
B	=	Diameter of pile (m)

q = Effective overburden pressure at pile toe (kN/m^2)

N_c = Bearing Capacity Factor (Recommended equal to 9)

N_q, N_γ = Bearing Capacity Factor

8.5. Lateral load capacity of piles in soils:

$$Q_u = 12.E.I.\delta/(L_1+L_f)^3$$

where,

Q_u = Ultimate lateral load capacity of pile (kN)

δ = Permissible deflection (m) = 5 mm

E = Young Modulus of pile material (kN/m^2)

I = Moment of Inertia of the pile cross section (m^4)

L_1 = Cantilever Length of pile (m)

L_f = Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-1 to 2** of **Appendix-H.**

Pile lateral Load capacity has been given in **Table-3 to 4** of **Appendix-H**.

9. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (energy efficiency factor)

Design Earthquake Base:

Earthquake zone = IV

Magnitude of earthquake = 7

Seismic Zone factor = 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

$<$ 1.00 : Stratum is to be considered as liquefiable

$>$ 1.20 : Non-Liquefiable

The detailed calculations of liquefaction, have been reported in **Table-5** of **Appendix-H.**

10. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

10.1. **Bored Cast-In-Situ RCC Piles** of diameter 1000 and 1200 mm have been adopted for SBC computations of foundation for Viaduct.

10.2. **Cut off length** of piles have been considered as 2.50 m from the existing ground level for the purpose of computation of SBC.

10.3. **Pile length** recommended in the table below, shall be measured **after the cut-off depth.**

10.4. **Allowable load carrying capacity** of pile corresponding to the length and diameter of pile shall be read from the tables below:

10.4.1. For Pile diameter = 1000 mm

Borehole No.	Pile Length (m)	Load carrying Capacity (kN)		
		Compression	Uplift	Lateral Concrete M35*
P101	25.00	2900	1750	85

10.5. Liquefaction Potential: All the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. Out of which several boreholes show the potential at various depths mentioned in the table below:

Bore No.	Liquefiable depth zone (meter)
P101	Top 5.00
P102	Top 3.00, 4.00 to 6.00 & 7.00 to 8.00

Bore No.	Liquefiable depth zone (meter)
P103	Top 4.00
P104	Top 5.00
P105	3.00 to 4.00, 5.00 to 9.00 & 13.00 to 14.50
P106	None
P111	None

Soil investigation for HORC Viaduct between Sohana & Dhulawat stations, Haryana

APPENDIX "B"
TABLE 7: SUMMARY OF TEST RESULTS

Bore No: P111	**Ground Elevation: RL 194.745 m**	**Method of drilling: Rotary**	**Depth of Water-table: 1.30 m**
Diameter of Bore Hole: 150 mm	**Bore Retained using: Casing**	**Starting Date: 18/10/2023**	**SPT Sampler: Standard**
Location / Chainage: 23830.447	**Casing Lowered: 15.00 m**	**Ending Date: 21/10/2023**	**Hammer type: Rope-pulley driven**

National Accreditation Board for
Testing and Calibration Laboratories

NABL

CERTIFICATE OF ACCREDITATION

TECHPRO ENGINEERS PVT. LTD. (LABORATORY DIVISION)

has been assessed and accredited in accordance with the standard

ISO/IEC 17025:2017

"General Requirements for the Competence of Testing & Calibration Laboratories"

for its facilities at

114, RAM GANGA HOUSING SOCIETY, NARAMAU, G.T. ROAD, KANPUR, UTTAR PRADESH, INDIA

in the field of

TESTING

Certificate Number: TC-9169

Issue Date: 23/12/2022 Valid Until: 22/12/2024

This certificate remains valid for the Scope of Accreditation as specified in the annexure subject to continued satisfactory compliance to the above standard & the relevant requirements of NABL.
(To see the scope of accreditation of this laboratory, you may also visit NABL website www.nabl-india.org)

Name of Legal Identity : Techpro Engineers Private Limited

Signed for and on behalf of NABL

Dec 05th; 2023

ACKNOWLEDGEMENTS

We are pleased to submit the part-7 of the report of Geotechnical investigation, conducted for the boreholes P114A to P133A for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)

Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -7 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers P114A to P133A.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15’ N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

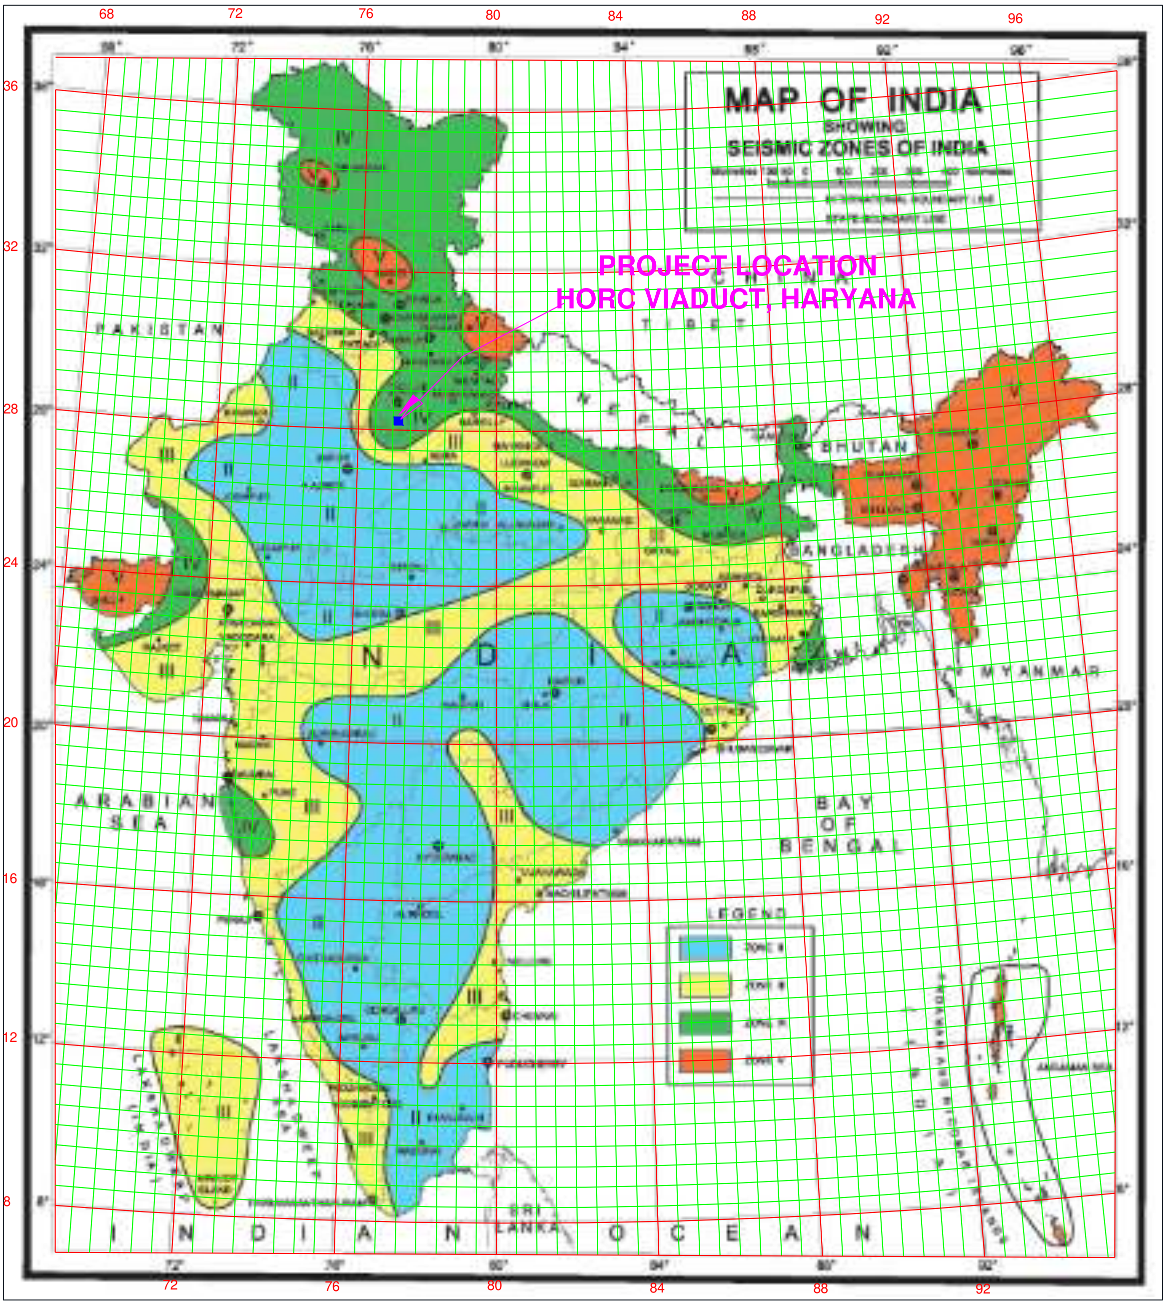

Fig.1: Seismic Zone Map of India

4. FIELD INVES TIGATION:

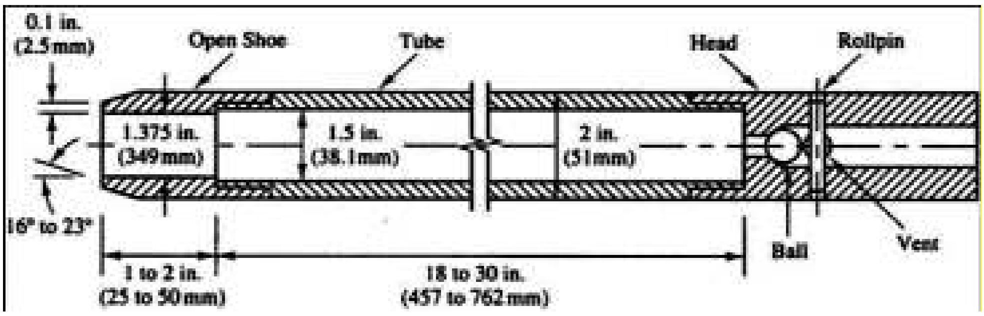
The field investigation work at this site was carried out from Oct

31st; 2023 to Nov 3rd; 2023 and Nov 18th ;2023 to Nov 21st ;2023. The following investigation work was carried out:

4.1. **Twenty** numbers of borehole were proposed to be made at this stretch, out of which two number of **boreholes** (marked as 116A and 120A) of diameter 150 mm in soil were made for conducting Standard Penetration Test and collection of disturbed and undisturbed samples. The boreholes were progressed using power operated winch machine under **percussion** method of drilling. Casing was used to keep the borehole stable and Bentonite was also used as drilling mud to help prevent wall collapse of boreholes at deeper depth. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in "TEST LOCATION PLAN" in Appendix A.

4.2. **Standard Penetration Tests** were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **rope-pulley driven hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is termed the penetration resistance N. The N' values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		Correlation For Sand/Non-Plastic Silt	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 50 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77 \times \log (2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 and 2 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. **Disturbed soil samples** were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 and 2 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. **Undisturbed soil samples** were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness of not less than 25 mm. The laboratory test results have been reported in Table 1 and

2 of Appendix-B.

4.5. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.6. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 and 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 and 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 and 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 and 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.5. **Atterbergs' limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 and 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) -

1980-(RA: 2021) and the results have been reported in Table 1 and 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.7. **Consolidation tests** were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 and 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.8. **Direct shear tests** were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 and 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.9. **Tri-axial Compression Test** under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 and 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.10. **Unconfined Compressive strength tests** were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 3 of Appendix B.

5.11. **Shrinkage Limit tests** were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 and 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.12. **Free Swell Index** were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 and 2: “SUMMARY OF TEST RESULTS” of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced Level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P116A	23961.447	700986.631	3120897.53	195.485	40.00	1.90

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced Level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P120A	24066.247	700978.032	3121001.95	196.008	40.00	5.00

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS: 13365-1. The detailed nature of the strata has been reported in Table 1: "SUMMARY OF TEST RESULTS" of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in both the bore holes, is predominantly comprising of inorganic silty clays of low plasticity and inorganic silts of non to low plastic category. Silty sands were encountered at varying depth and thickness.

8. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation **(Bored Cast-In-Situ RCC piles)** have been considered for computation of load bearing capacity of the underlying soil strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020) with due consideration of effects of liquefaction.

8.1. Design Parameters:

Factor of safety in Compression	=	2.50
Factor of safety in Tension	=	3.00
Depth of critical water table	=	0.00 m
Diameter of pile	=	1.00 & 1.20 m
Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

8.2. Computation of friction along pile stem:

$$Q_{uf} = \sum K_i . P_{di} . \tan\delta_i . A_{si}$$

where,

Q_{uf} = Ultimate shaft friction (kN/m^2)

K_i = Coefficient of earth pressure at mid-depth of i^{th} layer

P_{di} = Effective overburden pressure at mid-depth of i^{th} layer (kN/m^2)

A_{si} = Surface area of pile stem in i^{th} layer (m^2)

δ_i = Angle of wall friction between pile and soil of i^{th} layer (= ϕ) (degree)

ϕ_i = Angle of internal friction of soil in i^{th} layer (degree)

$\sum$ = Sum of all layers up to i^{th} layer

8.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \sum \alpha_i . c_i . A_{si}$

Where,

c_i = Cohesion in i^{th} layer

A_{si} = Surface area of pile stem in i^{th} layer (m^2)

α_i = Adhesion factor for i^{th} layer of soil depending of consistency of soils

$\sum$ = Sum of cohesion of all layers considered

8.4. Computation of end bearing resistance:

$Q_{ub} = A_p\,(c.Nc + q.Nq + 0.5.\,\gamma.B.N\gamma)$

Where,

A_p = Area of the pile toe (m^2)

c = cohesion of soils at pile toe (kN/m^2)

γ = Effective Unit weight of soils at pile toe (kN/m^3)

B = Diameter of pile (m)

q = Effective overburden pressure at pile toe (kN/m^2)

N_c = Bearing Capacity Factor (Recommended equal to 9)

Nq, $N\gamma$ = Bearing Capacity Factor

8.5. Lateral load capacity of piles in soils:

$Q_u = 12.E.I.\delta/(L_1+L_f)^3$

where,

Q_u = Ultimate lateral load capacity of pile (kN)

δ = Permissible deflection (m) = 5 mm

E = Young Modulus of pile material (kN/m^2)

I = Moment of Inertia of the pile cross section (m^4)

L_1 = Cantilever Length of pile (m)

L_f = Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-1 to 2** of **Appendix-H.**

Pile lateral Load capacity has been given in **Table-3 to 4** of **Appendix-H**.

9. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (energy efficiency factor)

Design Earthquake Base:

Earthquake zone	= IV
Magnitude of earthquake	= 7
Seismic Zone factor	= 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

$<$ 1.00 : Stratum is to be considered as liquefiable

$>$ 1.20 : Non-Liquefiable

The detailed calculations of liquefaction, have been reported in **Table-5** of **Appendix-H.**

10. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

10.1. Bored Cast-In-Situ RCC Piles of diameter 1000 and 1200 mm have been adopted for SBC computations of foundation for Viaduct.

10.2. **Cut off length** of piles have been considered as 2.50 m from the existing ground level for the purpose of computation of SBC.

10.3. **Pile length** recommended in the table below, shall be measured **after the cut-off depth.**

10.4. **Allowable load carrying capacity** of pile corresponding to the length and diameter of pile shall be read from the tables below:

10.4.1. For Pile diameter = 1000 mm

Borehole No.	Pile Length (m)	Load carrying Capacity (kN)		
		Compression	Uplift	Lateral Concrete M35*
P116A	25.00	2650	1550	65
	27.50	2700	1800	
	30.00	3550	2050	
	32.50	3800	2300	
	35.00	4000	2550	
P120A	25.00	2650	1650	55
	27.50	2850	1850	
	30.00	3100	2050	
	32.50	3600	2300	
	35.00	3700	2500	

** Indicates Grade of Concrete*

10.4.2. For Pile diameter = 1200 mm

Borehole No.	Pile Length (m)	Load carrying Capacity (kN)		
		Compression	Uplift	Lateral Concrete M35*
P116A	25.00	4050	2100	95
	27.50	4000	2450	
	30.00	5600	2850	
	32.50	5950	3200	
	35.00	6300	3600	
P120A	25.00	4050	2150	85
	27.50	4300	2500	
	30.00	4600	2800	
	32.50	5500	3150	
	35.00	5600	3500	

** Indicates Grade of Concrete*

10.5. Liquefaction Potential: All the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. Out of which several boreholes show the potential at various depths mentioned in the table below:

Bore No.	Liquefiable depth zone (meter)
P116A	Top 4.00 & 5.00 to 6.00
P120A	Top 3.00 & 6.00 to 7.00

ACKNOWLEDGEMENTS

We are pleased to submit the part-8 of the report of Geotechnical investigation, conducted for the boreholes P134A to P148A and A2A for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)

Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -8 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers P134A to P148A and A2A.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15’ N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

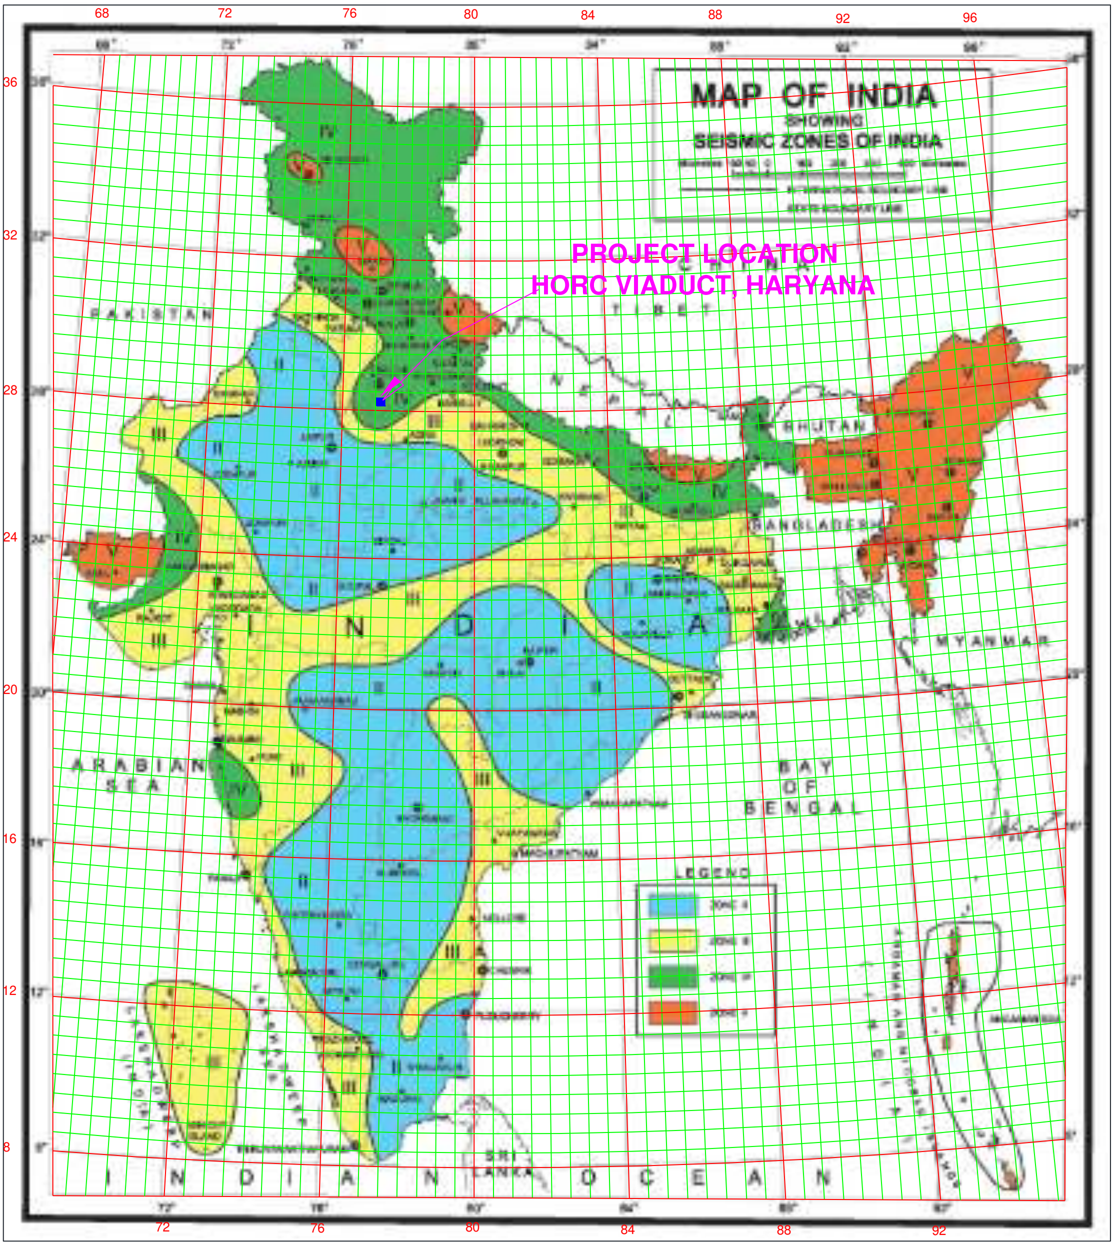

Fig.1: Seismic Zone Map of India

4. FIELD INVESTIGATION:

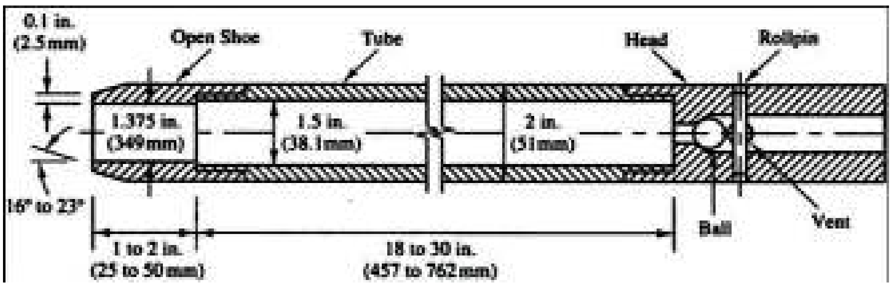
The field investigation work at this site was carried out from Nov 1st; 2023 to Nov 4th; 2023 & Nov 25th; 2023 to Nov 27th; 2023. The following investigation

work was carried out:

4.1. **Sixteen numbers** of boreholes were proposed to be made in this stretch, out of which **two number** of **borehole** (marked as P134A & P146A) of diameter 150 mm in soil and 75 mm in rock were made for conducting Standard Penetration Test and collection of disturbed, undisturbed soil and rock core samples. The borehole was progressed using hydraulic rig and power winch machine under **rotary** and **percussion** methods of drilling. Casing was used to keep the borehole stable and Bentonite was also used as drilling mud to help prevent wall collapse of boreholes at deeper depth. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in “TEST LOCATION PLAN” in Appendix A.

4.2. **Standard Penetration Tests** were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **auto-trip hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is

termed the penetration resistance N. The N' values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		Correlation For Sand/Non-Plastic Silt	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 50 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77x \log(2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 to 2 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. Disturbed soil samples were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 to 2 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. Undisturbed soil samples were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness

of not less than 25 mm. The laboratory test results have been reported in Table 1 to 2 of Appendix-B.

4.5. **Rock Core samples** recovered during the NX size drilling have been measured, numbered, and packed in core boxes. The Core Recovery (CR) and RQD information have been reported in Field bore log charts and Core Measurement Sheet and results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B**.**

4.6. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.7. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 to 2: "SUMMARY OF TEST

RESULTS" of Appendix B.

5.5. **Atterbergs' limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) -1980-(RA: 2021) and the results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.7. **Consolidation tests** were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.8. **Direct shear tests** were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.9. **Tri-axial Compression Test** under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.10. **Unconfined Compressive strength tests** were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 3 of Appendix B.

5.11. **Shrinkage Limit tests** were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.12. **Free Swell Index** were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.13. **Density test** on rock sample were performed in accordance with IS 13030-1991-(RA: 2021) and results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.14. Water absorption and Porosity test on rock samples were performed in accordance with IS: 1124-1974-(RA:2017) and results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.15. Hardness test on rock samples were performed in accordance with IS: 13630 (part-XIII) -2019 and results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.16. Unconfined Compressive Strength tests on rock samples were performed in accordance with IS 9143-1979-(RA:2021) and results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.17. Point load index tests on rock samples were performed in accordance with IS: 8764-1998-(RA:2019) and results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

5.18. Cerchar Abrasive Index test on rock samples were performed in accordance with ASTM-D7625 and results have been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P134A	24433.047	700904.347	3121360.768	200.107	40.00	9.20
P146A	24747.447	700789.522	3121563.095	207.274	12.50	9.10

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS: 13365-1. The detailed nature of the strata has been reported in Table 1 to 2: "SUMMARY

OF TEST RESULTS" of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in the bore hole P134A is predominantly consisting of silty sands, with inorganic silty clays of low plastic category and inorganic silts of non to low plastic category. Borehole P146A is consists of slightly to highly weathered fine grained quartzite rock mass which the top covered with a small thickness of 0.50 m with silty sands, till the depth of investigation.

8. CLASSIFICATION CRITERIA OF ROCK MASSES:

Rock classification in terms of weathering, state of fractures and strength is carried out in the following manner based on IS: 4464-1985, IS: 13365-1. Tabulations given in below explain it briefly.

TERMS	DESCRIPTION	GRADE	GEOLOGIST INTERPRETATION
Fresh	No visible sign of rock material weathering; perhaps slight coloration on major discontinuity surfaces	I	CR > 90 %
Slightly Weathered	Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discoloured by weathering.	II	CR between 70 % to 90 %
Moderately Weathered	Less than half of the rock material is decomposed or disintegrated to a soil. Fresh or discoloured rock is present either as a continuous framework or as core-stones.	III	CR between 51 % to 70 %
Highly Weathered	More than half of the rock material is decomposed or disintegrated to a soil. Fresh or discoloured rock is present either as a discontinuous framework or as core-stones.	IV	CR between 11 % to 50 %
Completely weathered	All rock material is decomposed and / or disintegrated to soil. The original mass structure is still largely intact.	V	CR between zero to 10 %
Residual Soil	All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported.	VI	CR = Zero % But N > 50

CR indicate Core Recovery

It should be understood that all grades of weathering may not be seen in a given rock mass and that in some cases a particular grade may be present to a very small extent. Distribution of the various weathering grades of rock material in the rock mass may be related to the porosity of the rock material and the presence of open discontinuities of all types in the rock mass.

8.1 Relation between RQD and In-situ Rock quality:

Relation between RQD and In-situ Rock quality is further measured by frequency of natural joints in rock mass. Rock Quality Designation (RQD) is used to define state of fractures or massiveness of rock. Following table defines the quality of rock mass.

RQD classification	RQD (%)
Excellent	91 to 100
Good	76 to 90
Fair	51-75
Poor	25-50
Very Poor	0-25

8.2 Classification of Rock by Compressive Strength:

Rock type	Unconfined compressive strength (MPa)
Extremely strong	>200
Very Strong	100 to 200
Strong	50 to 100
Moderately Strong	12.5 to 50
Moderately Weak	5 to 12.5
Weak	1.25 to 5
Very weak	<1.25

9. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation proposed to be resting on soil and rock mass **(Bored Cast-In-Situ RCC piles** and **bored cast-in-situ rock socketed RCC piles)** have been considered for computation of load bearing capacity of the underlying strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020), with due consideration of effects of liquefaction and rock socketed RCC piles as per IRC:78-2014

9.1. Pile Load Capacity in soils:

9.1.1. Design Parameters:

Factor of safety in Compression	=	2.50
Factor of safety in Tension	=	3.00
Depth of critical water table	=	0.00 m
Diameter of pile	=	1.00 & 1.20 m
Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

9.1.2. Computation of friction along pile stem:

$Q_{uf} = \sum K_i . P_{di} . \tan\delta_i . A_{si}$

where,

Q_{uf} = Ultimate shaft friction (kN/m^2)

K_i = Coefficient of earth pressure at mid-depth of i^{th} layer

P_{di} = Effective overburden pressure at mid-depth of i^{th} layer (kN/m^2)

A_{si} = Surface area of pile stem in i^{th} layer (m^2)

δ_i = Angle of wall friction between pile and soil of i^{th} layer (= ϕ) (degree)

ϕ_i = Angle of internal friction of soil in i^{th} layer (degree)

$\sum$ = Sum of all layers up to i^{th} layer

9.1.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \sum \alpha_i . c_i . A_{si}$

Where,

c_i = Cohesion in i^{th} layer

A_{si} = Surface area of pile stem in i^{th} layer (m^2)

α_i = Adhesion factor for i^{th} layer of soil depending of consistency of soils

$\sum$ = Sum of cohesion of all layers considered

9.1.4. Computation of end bearing resistance:

$$Q_{ub} = A_p (c.Nc + q.Nq + 0.5.\gamma.B.N\gamma)$$

Where,

A_p = Area of the pile toe (m^2)

c = cohesion of soils at pile toe (kN/m^2)

γ = Effective Unit weight of soils at pile toe (kN/m^3)

B = Diameter of pile (m)

q = Effective overburden pressure at pile toe (kN/m^2)

N_c = Bearing Capacity Factor (Recommended equal to 9)

Nq, Nγ = Bearing Capacity Factor

9.1.5. Lateral load capacity of piles in soils:

$Q_u = 12.E.I.\delta/(L_1+L_f)^3$

where,

Q_u = Ultimate lateral load capacity of pile (kN)

δ = Permissible deflection (m) = 5 mm

E = Young Modulus of pile material (kN/m^2)

I = Moment of Inertia of the pile cross section (m^4)

L_1 = Cantilever Length of pile (m)

L_f = Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-4 to 5** of **Appendix-I.**

Pile lateral Load capacity has been given in **Table-6 to 7** of **Appendix-I**.

9.2. Pile Load Capacity in rock:

Computations of the vertical load capacity of the piles in rock has been work out as per the method given in IRC:78-2014.

9.2.1. As per IRC:78-2014 (Method-1):

If the rock mass encountered at this site exhibits (CR+RQD)/2 > **30%**, Method 1 of IRC: 78-2014 shall be been used for computing the axial pile load capacity in rock formations.

$$Q_a = R_e/3 + R_{af}/6$$

where,

R_e = K_{sp} x D_f x q_c x A_b

R_{af} = C_{us} x A_s

D = Diameter of the pile (m)

Q_a = Allowable load capacity of pile socketed into rock (kN/m^2)

R_e = Ultimate end bearing capacity (kN/m^2)

R_{af} = Ultimate side socket shear capacity (kN/m^2)

K_{sp} = empirical value ranging from 0.3 to 1.2

L_s = Socket length of pile (m)

D_f = Depth factor =1 + 0.4 L_s/D (≤ 1.2)

q_c = average unconfined compressive strength below base of pile (up to 2D)

A_b = Area of pile base (mm^2)

A_s = Area of socket (mm^2)

C_{us} = Estimated average shear strength of rock along socket length (≤ 3.0 for M35 Concrete).

9.2.2. As per IRC:78-2014 (Method-2):

If the rock mass encountered at the site exhibits (CR+RQD)/2< **30%**, Method 2 of IRC: 78-2014 shall be been used for computing the axial pile load capacity in rock formations.

$$Q_a = R_e/3 + R_{af}/6$$

$$Q_t = R_{af}/6 + \text{Self weight of pile}$$

where,

R_e = C_{ub} x N_c x A_b

R_{af} = C_{us} x A_s

D = Diameter of the pile (m)

Q_a = Allowable load capacity of pile socketed into rock (kN)

Q_t = Allowable load capacity of pile in uplift (kN)

R_e = Ultimate end bearing capacity (kN/m^2)

R_{af} = Ultimate side socket shear capacity (kN/m^2)

C_{ub} = Average shear strength below base of pile tip for depth upto 2D

L_s = Socket length of pile (m)

N_c = Bearing Capacity factor = 9 (as per code)

A_b = Area of pile base (m^2)

A_s = Area of socket (m^2)

C_{us} = Shear strength along socket length (≤ 3.0 for M35 Concrete).

The detailed calculations of pile load carrying capacity in compression and uplift on rock based on method-1 of IRC:78-2014 have been reported in **Table-2 & 3** of **Appendix-I.**

9.3. Computation of RMR values:

A gross estimate of bearing capacity of completely or partially weathered rock masses have been done based on Rock Mass Rating (RMR). The estimation of RMR value of jointed rock masses have been worked out based on IS 13365 (part I). Rock Mass Rating parameters are reproduced from Annexure B of IS 13365 (part I) below for ready reference. The final RMR value of rock is referred from the Table 3 of IS code 12070.

9.3.1. Rating as per UCS

Description	Compressive Strength (MPa)	Rating	Basis
Exceptionally Strong	>250	15	UCS value data of specific borehole from laboratory test is used in RMR
Very Strong	100 to 250	12	
Strong	50 to 100	7	
Average	25 to 50	4	
Weak	10 to 25	2	
Very Weak	2 to 10	1	
Extremely Weak	<2	0	

9.3.2. Rating as per RQD

Description	RQD (%)	Rating	Basis
Excellent	91 to 100	20	RQD values of specific boreholes below given depth from relevant borehole are used in RMR.
Good	76 to 90	17	
Fair	51 to 75	13	
Poor	26 to 50	8	
Very Poor	0 to 25	3	

9.3.3. Rating as per Spacing of discontinuities

Description	Spacing (m)	Rating	Basis
Vey wide	>2	20	Spacing of discontinuities of specific borehole from field observations is used in RMR
Wide	0.6 to 2	15	
Moderate	0.2 to 0.6	10	
Close	0.06 to 0.2	8	
Very close	<0.06	5	

9.3.4. Rating as per Condition of discontinuities

Condition	Rating
Very rough and un-weathered rock wall rock, tight and discontinuous, no separation	30
rough and slightly weathered wall rock surface, separation < 1mm	25
slightly rough and moderately to highly weathered wall rock surface, separation< 1mm	20
Slickensides wall rock surface or 1-5mm thick gauge or1-5 mm wide opening, continuous discontinuity	10
Soft gauge> 5 mm thick or Separation > 5 mm	0

9.3.5. Rating as per Ground Water Conditions

General Description	Rating
Completely dry	15
Damp	10
Wet	7
Dripping	4
Flowing	0

9.3.6. Rating as per adjustment for discontinuity orientations

Strike and dip orientations of discontinuities	Very favourable	Favourable	Fair	Un-favourable	Very Un-favourable
Foundation	0	-2	-7	-15	-35

9.3.7. Net safe bearing pressures based on RMR as per Table 3 of IS:12070-1987-(RA: 2020)

Classification No.	I	II	III	IV	V
Rock Description	Very Good	Good	Fair	Poor	Very Poor
RMR	100-81	80-61	60-41	40-21	20-0
Q_{net} (t/m^2)	600-448	440-288	280-141	135-48	45-30

The results of Rock Mass Rating have been reported in **Table-1** of **Appendix-I.**

10. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (energy efficiency factor)

Design Earthquake Base:

Earthquake zone	= IV
Magnitude of earthquake	= 7
Seismic Zone factor	= 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

$<$ 1.00 : Stratum is to be considered as liquefiable

$>$ 1.20 : Non-Liquefiable

The detailed calculations of liquefaction, have been reported in **Table-8** of **Appendix-I.**

11. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

11.1. Bored Cast-In-Situ RCC Piles of diameter 1000 and 1200 mm have been adopted for

SBC computations of foundation for Viaduct.

11.2. Cut off length of piles have been considered as 2.50 m for piles in soil and 2.00 m for pile in rock from the existing ground level for the purpose of computation of SBC.

11.3. Pile length recommended in the table below, shall be measured **after the cut-off depth.**

11.4. Allowable load carrying capacity of pile corresponding to the length and diameter of pile shall be read from the tables below:

11.4.1. For Pile diameter = 1000 mm

Borehole No.	End bearing Strata type	Pile Length (m)	Rock Socket length (m)	Load carrying Capacity (kN)		
				Compression	Uplift	Lateral Concrete M35*
P134A	Soils	25.00	-	2450	1600	235
		27.50	-	2750	1750	
		30.00	-	2500	1950	
		32.50	-	3500	2150	
		35.00	-	2900	2300	
P146A	Rock	3.50	3.50	7650	3800	-

* *Indicates Grade of Concrete*

11.4.2. For Pile diameter = 1200 mm

Borehole No.	End bearing Strata type	Pile Length (m)	Rock Socket length (m)	Load carrying Capacity (kN)		
				Compression	Uplift	Lateral Concrete M35*
P134A	Soils	25.00	-	3700	2250	330
		27.50	-	4250	2500	
		30.00	-	3700	2800	
		32.50	-	5400	3100	
		35.00	-	4250	3350	
P146A	Rock	4.20	4.20	11400	5850	-

* *Indicates Grade of Concrete*

11.5. Liquefaction Potential: Both the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. Out of which none of the boreholes show the liquefaction potential.

ACKNOWLEDGEMENTS

We are pleased to submit the part-10 of the report of Geotechnical investigation, conducted for the boreholes P134B to P148B and A2B for the design of foundations for HORC Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) project in the state of Haryana, India.

We hereby, convey our sincere thanks to Mr. Neeraj Bhandari (CPM/South) and Mr. Raju Solanki (DGM/C/South), HRIDCL for trust and support during the investigation. We also acknowledge our thanks to Mr. Uma Maheshwara Rao B, DGM/C/West, HRIDCL for awarding the said work to us. We are also grateful Mr. Ravindra Dutta Upadhyay (Geotech Expert), Mr. PS Gautam & Mr. Jitender Parashar, Site Engineer from the RITES- SMEC JV and Mohd. Ishak (Executive/Civil) from HRIDCL, for their help rendered during and prior to the investigation work.

We are also thankful to our staff members for conducting field and laboratory test, preparing sketches, and typing the report.

for Techpro Engineers Pvt. Ltd.

(Arvind K. Garg)
B.Tech. (Civil), M.Tech.
Principal Consultant &
Managing Director

1. INTRODUCTION:

Haryana Rail Infrastructure Development Corporation Ltd. (HRIDC) and Ministry of Railways, Govt. of India has come together to form a new company namely Haryana Orbital Rail Corporation Limited (HORCL), to design and construction of new BG line from Palwal to Sonipat named Haryana Orbital Rail Corridor (HORC), in the state of Haryana, India. In this connection, a Geotechnical investigation has been planned for the design of foundations of Viaduct between Sohana & Dhulawat stations of Haryana Orbital Rail Corridor (HORC) Project in the state of Haryana. The work of conducting the detailed Geotechnical Investigation has been awarded to us by HRIDC, through work order No. HRIDC/HORC/GTI/211/2023-2024/Vol-0 dated 02-09-2023, which includes investigation in field, laboratory testing of disturbed and undisturbed samples, collected from the field, and submission of the geotechnical **investigation** test report.

A geotechnical investigation was carried out, with the locations, planned by the client. Purpose of the investigation is to determine the nature and properties of soil and rock strata across the bore holes and representing them through log sections showing the levels, nature, and properties of various strata up to a sufficient depth below the founding level, proneness of site to artesian conditions, seismic disturbance and other engineering properties of soil and rock strata.

This part -10 of the report includes the detailed methodology of investigation, collection of samples, field and laboratory test result including their interpretation/ analysis, recommendations on the properties of soils and rock required for design of foundation and suggesting suitable type and depth of foundation with allowable bearing capacity for safe and strong foundations for the Bore Hole numbers P134B to P148B and A2B.

2. SCOPE OF WORK:

For the design of foundation of viaduct, it is required to determine the allowable bearing capacity together with necessary engineering characteristics of underlying soil & rock strata. In general, the geotechnical investigation has been planned as per IS:1892-2021 and further extended to IS: 1904, IS:2911 (part-1/Sec 2) & IRC 78:2014 for planning the laboratory testing and computing the allowable bearing capacity, hence the scope of work is as follows:

2.1. Mobilisation of all tools & plants along with accessories, materials, labours etc. at site of work for drilling and testing work, including setting up boring and shifting to different bore holes point etc.

2.2. Exploratory drilling of 150 mm diameter bore holes through soil deposits and 75 mm in rock within the proposed alignment upto the required depth.

2.3. Collection of disturbed soil samples at an interval of 3.00 meter in all the bore holes.

2.4. Collection of undisturbed soil samples at every 3.00 m interval or at change of stratum from all the boreholes.

2.5. To conduct Standard Penetration Test (SPT) at an interval of 3.00 m or noticeable change of stratum in soil deposits in all bore holes.

2.6. Collection of rock core samples and preserving them in core boxes.

2.7. To collect ground water sample on completion of bore holes.

2.8. To record the ground water table in all the bore holes.

2.9. Transporting all the disturbed, undisturbed soil and rock core samples collected during the field investigation to our NABL accredited Geotech Engineering laboratory at Kanpur.

2.10. To conduct the laboratory tests on all the soil and rock core samples collected during field investigation for determination of their engineering characteristics.

2.11. To compile of field and laboratory test results, working out the allowable bearing capacity and preparing the report including detailed recommendations and necessary precautions.

3. GEOLOGICAL INFORMATION OF THE REGION:

3.1. Geography:

The project location is in the bordering area of Gurugram and Nuh (recent old name-Mewat), districts in the Indian state of Haryana. The stretch of the alignment of the proposed corridor starts from southmost part of Gurugram in the town of Sohna and ends at Dhulawat, which is a village lying at the north of Nuh district.

Haryana is a state located in the northern part of India. Gurugram is among one

of the districts in Haryana which is also the part of National Capital Region (30km south of New Delhi). It lies at an elevation of 217 m above msl. Sohna is a small town located 25km in the south of Gurugram. Sohna is well known for its hot water springs and famous Shiva temple. Sohna is located in between 28°15' N latitude and 77°40' E longitude at the elevation of 212.14m above msl. Mewat district is located at 28 °12′ N latitude, 77 °3′ E longitude, at the south of Gurugram at an elevation of 199 m above msl. The location is bordered by Rewari district on west and Faridabad & Palwal district on the east.

3.2. Geology:

The Gurugram district is having of almost flat topography, however, in the north-eastern part small isolated hillocks of Precambrian rocks are exposed. Small hill ranges which are part of the Aravali and Mangar Bani ranges exists in the district. The major part of district is underlain by Quaternary alluvium consisting of sand, clay and silt. The alluvial plain is formed by the Sahibi river which is a tributary of River Yamuna. Soils of the Gurgaon district is classified as tropical and brown soils, existing in the north western extreme, northern and north eastern parts of the district and water logged and salt affected soils in the southern parts of the district. The soils are medium textured loamy sand is the average texture in Gurgaon and Sohna blocks.

3.3. Rainfall and Climate:

The area has hot semi-arid type of climate characterising extreme dryness of the air except in the monsoon season. Intense hot summer and cold winters. The total annual rainfall in the region is about 596 mm, of which 75 to 80% is because of the south-west monsoon.

3.4. Seismicity:

The site under consideration exists in the district of Gurugram and Mewat which lies in the Seismic Zone IV (high damage risk zone), as per the current seismic zonation map of India (IS 1893-2016): RA 2021 and have a zone factor of 0.24 for design basis earthquake. The region is surrounded by many in-homogeneities in the form of faults and ridges like Sohna Fault, Moradabad Fault, Delhi-Moradabad Fault, Delhi-Haridwar ridge, junction of Aravalli and Alluvium near Delhi. The Sohna fault line lies between the Delhi ridge and Sohna town and falls between the Arjangarh and

Manesar outcrops. All the developed area in Gurugram comes within 200 km of the fault line. The Sohna fault line is located at the junction between the hard rock terrain of the Aravalli hills and the sandy formation of the Yamuna River and is currently inactive from several years and is capable of a disastrous earthquake.

The project location has been marked in Fig.1 Seismic zone map of India.

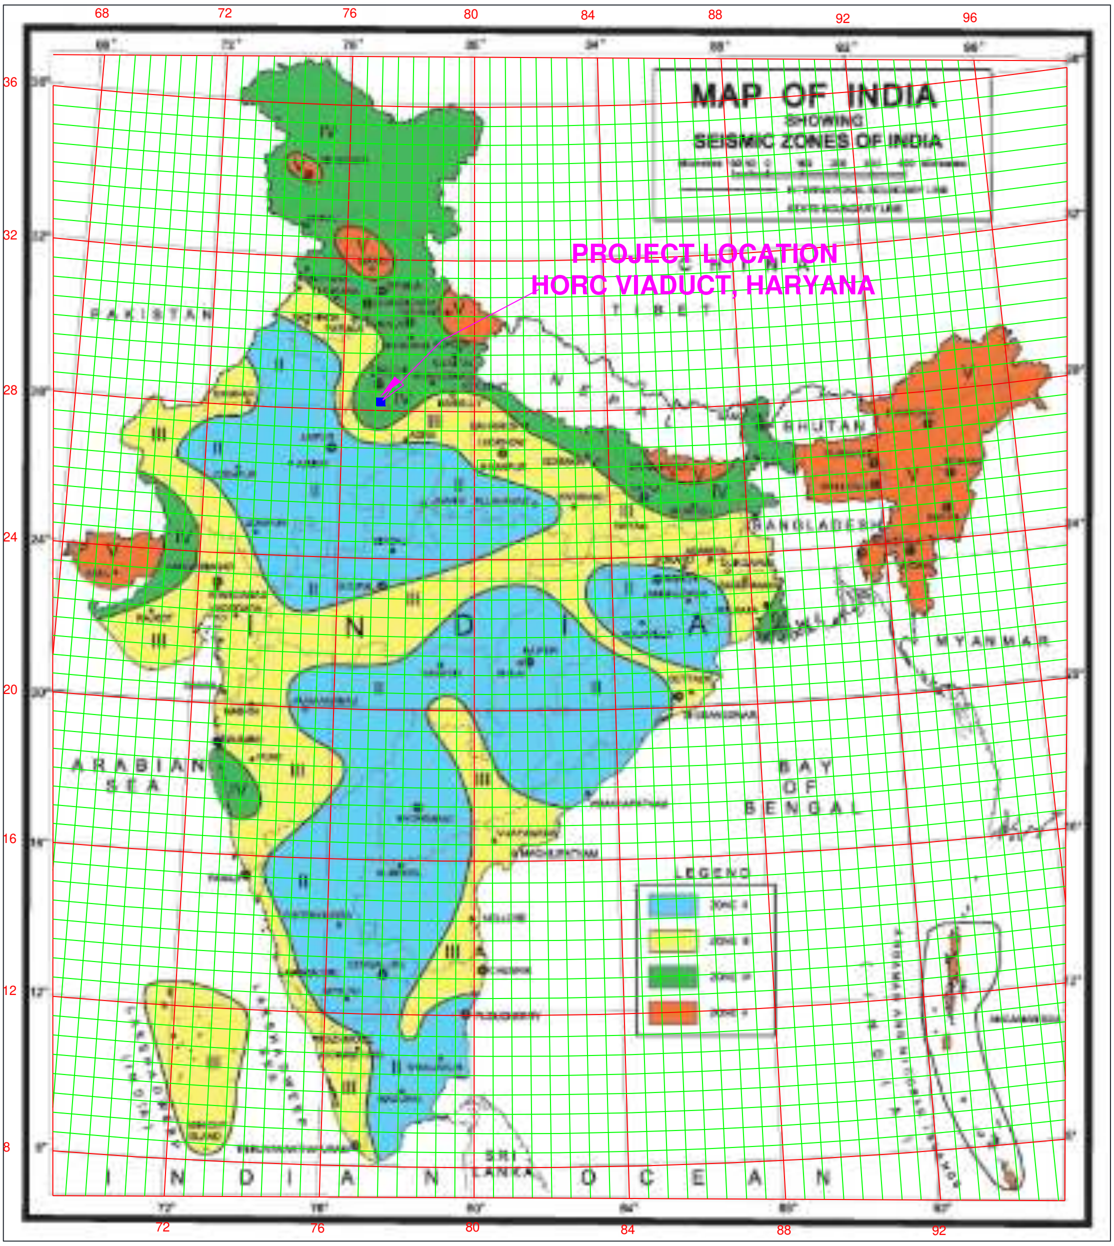

Fig.1: Seismic Zone Map of India

4. FIELD INVESTIGATION:

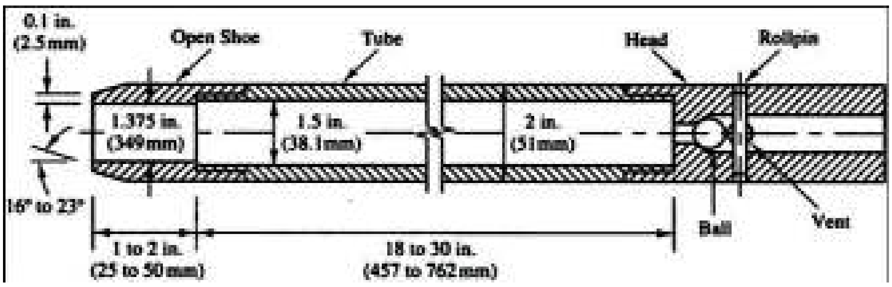
The field investigation work at this site was carried out from Sep 19th; 2023 to Sep 23rd; 2023 & Nov 26th; 2023 to Nov 28th; 2023. The following investigation

work was carried out:

4.1. **Sixteen** number of **boreholes** were proposed to be made at this stretch, out of which **two number** of boreholes (marked as P138B & P143B) of diameter 150 mm in soil and 75 mm in rock were made for conducting Standard Penetration Test and collection of disturbed, undisturbed soil and rock core samples. The boreholes were progressed using hydraulic rig and power winch machine under **rotary** and **percussion** methods of drilling. Casing was used to keep the borehole stable and Bentonite was also used as drilling mud to help prevent wall collapse of boreholes at deeper depth. The records of achieved depth of bore holes have been given in Para No. 6, the details of drilled bores along with depth of casing used have been reported in Appendix B. Locations of boreholes have been reported in "TEST LOCATION PLAN" in Appendix A.

4.2. **Standard Penetration Tests** were conducted at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth, as per the procedure in IS: 2131-1981-(RA: 2021) in all the bore holes. The **standard SPT sampler** (without liner and with no space for liner) and **rope-pulley driven hammer** of standard weight of 63.50 kg have been used to perform the test.

For conducting the test, the bottom of the borehole was properly cleaned, and split spoon sampler was properly seated in position in the borehole. The split spoon sampler resting on the bottom of borehole was allowed to sink under its own weight; then the sampler was allowed to penetrate 15 cm with the blows of the hammer 63.50 kg weight falling free through 75cm, thereafter the split spoon sampler was further driven by another 15 cm. For the 3rd and final drive, the sampler was further allowed to penetrate 15 cm. The number of blows required to get each 15 cm of penetration, was recorded. The first 15 cm of drive is seating drive.



Structure of SPT Sampler

The total blows of penetration for the second and third 15 cm of penetration is

termed the penetration resistance N. The N' values are indicative of the compactness/ relative density of cohesion less soils and consistency of cohesive soils.

In case the blows count of SPT in soil (including the number of blows of seating) exceeds 100, the corresponding penetration was recorded and this particular test at that depth stopped. If the total penetration is more than the seating penetration of 15 cm, then breakup of blow counts for 15 cm seating penetration and for remaining portion of penetration is also given.

SPT 'N' values are correlated with non-cohesive stratum as per BS: 5930 (1999) – for sandy strata and with consistency of cohesive stratum.

Correlation For Clay/Plastic Silt		Correlation For Sand/Non-Plastic Silt	
Consistency of clays	**Penetration Value**	**Relative Density of sand**	**Penetration Value**
Very Soft	0 to 2 Blows	Very loose	0 to 4 Blows
Soft	3 to 4 Blows	Loose	5 to 10 Blows
Medium Stiff	5 to 8 Blows	Medium	11 to 30 Blows
Stiff	9 to 16 Blows	Dense	31 to 50 Blows
Very Stiff	17 to 32 Blows	Very Dense	Above 50
Hard	Above 32		

In this method, the sampler acts as a probe and the driving energy is supplied by the fall of the drop weight. The values of 'N' depend on the compactness or relative density of the material. In hard formations, the testing is discontinued if 'N' value is found to be more than 100. It is termed as 'Refusal'. Refusal is also recorded when SPT blow count records 50 or more for any of the single drive of 15 cm.

'N' value depends upon degree of saturation and over burden pressure of the formation. Silty fine sand and fine sand below the water table develop pore water pressure depending on the in-situ void ratio which in turn affects the effective stress. This change in effective stress influences the 'N' value considerably.

Depth of overburden affects the SPT values in none to low cohesive soils and hence need correction. The SPT value after the overburden correction, N' is as follows:

$$N' = 0.77x \log (2000/q) \times N$$

Where, q= Overburden Pressure (kN/m^2) and N = observed SPT value

N' is corrected further for dilatancy in case of saturated fine sands and silts for the values of N' greater than 15.

Modified value after dilatancy correction N" = 15+ (N'-15)/2

Soil samples obtained from split spoon sampler were collected in the polythene bags of suitable size. These samples were property sealed, labelled, and carefully transported to the laboratory for testing. The results have been reported in Table 1 to 2 of Appendix B under the title "SUMMARY OF TEST RESULTS".

4.3. Disturbed soil samples were collected at 0.50 metre, then at 1.00 to 2.00 metre interval upto the depth of 12.00 meter and 3.00 metre interval, beyond 12.00 metre depth and at significant change of stratum. Soil from cutting edge of SPT samplers and retained in split spoon, used for Standard Penetration Tests was taken as disturbed samples. These samples were placed without delay in adequately sealed polythene bags. Where the collection of disturbed soil samples could not be collected from SPT samples, Shelby tubes were driven and retained soil samples were obtained. The laboratory tests were conducted on the collected soil samples and reported in Table 1 to 2 of Appendix-B under the title "SUMMARY OF TEST RESULTS".

4.4. Undisturbed soil samples were collected in accordance with IS: 2132-1986-(RA: 2021) at an interval of 3.00 metre or at change of stratum, starting from the depth of 1.00 or 2.00 m, by using 100 mm dia. and 450 mm long MS tubes provided with sampler head with ball check arrangement. However, the some of the samples could not be extracted due to the partial penetration or slippage during the evacuation.

Moreover, collection of Undisturbed samples in very hard cohesive soils/ dense granular soils/gravels/ cobbles/ pebbles/ boulders, refusal strata is practically not possible and such collected samples will not truly represent the undisturbed conditions.

Immediately after taking undisturbed sample in the tube, the adopter head was removed along with the disturbed material. The visible ends of the samples shall then be trimmed off any wet disturbed soil. The ends will then be coated alternately with four layers of molten wax. More molten wax will then be added to give a total thickness

of not less than 25 mm. The laboratory test results have been reported in Table 1 to 2 of Appendix-B.

4.5. **Rock Core samples** recovered during the NX size drilling have been measured, numbered, and packed in core boxes. The Core Recovery (CR) and RQD information have been reported in Field bore log charts and Core Measurement Sheet and results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B**.**

4.6. The **ground water table** in the borehole was allowed to stabilize and measured after 8, 16, 24 and 48 hours after completion of the bore hole. It was ensured that last two reading were identical. The records of ground water table have been given in Para No.6.

4.7. **Ground water samples** were collected from borehole as per IS: 6935-1973-(RA:2019) for chemical analysis to determine aggressiveness in relation to attack on concrete / reinforcement including determination of pH value.

5. LABORATORY TESTS:

The following laboratory tests were conducted to determine the engineering characteristics of sub-soils:

5.1. **Field moisture contents** were determined by oven drying method as per IS: 2720 (part II)-1973-(RA: 2020). The results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.2. **Bulk density** of soil strata was obtained using Shelby tubes in accordance with IS 2720 (part XXIX)-1975-(RA: 2020). The results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.3. **Mechanical sieve analysis** test was performed in accordance with IS: 2720 (Part IV) – 1985-(RA: 2020), for the purpose of identification by grain size analysis, on coarse part of the soil samples and the results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.4. **Particle size analysis** test by **Hydrometer method** were performed in accordance with IS: 2720 (Part IV) -1985-(RA: 2020) on the part of soil samples obtained after the sieve analysis. The results have been reported in Table 1 to 2: “SUMMARY OF TEST

RESULTS” of Appendix B.

5.5. **Atterbergs’ limits tests** were performed in accordance with IS: 2720 (part V)-1985-(RA: 2020) and results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.6. **Specific gravity tests** were performed in accordance with IS 2720 (part III-sec. 1) -1980-(RA: 2021) and the results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.7. **Consolidation tests** were performed on cohesive soil samples in accordance with IS: 2720 (part XV)-1965-(RA: 2021). The results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.8. **Direct shear tests** were performed as per IS: 2720 (part XIII)-1986-(RA: 2021), on the undisturbed soil samples obtained during the field investigation. The results and the density of samples have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.9. **Tri-axial Compression Test** under Unconsolidated Un-drained (UU) condition as per IS: 2720 (Part-XI)-1993-(RA: 2021) were performed on the selected undisturbed soil samples, obtained during the field investigation. The results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.10. **Unconfined Compressive strength tests** were performed in accordance with IS 2720 (Part-X) -1991-(RA:2020) on selected undisturbed soil samples and the results have been reported in Table 5 of Appendix B.

5.11. **Shrinkage Limit tests** were performed in accordance with IS 2720 (part-VI) -1972-(RA: 2021) and the results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.12. **Free Swell Index** were performed in accordance with IS 2720 (part-XL) -1977-(RA: 2021) and the results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.13. **Density test** on rock sample were performed in accordance with IS 13030-1991-(RA: 2021) and results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.14. Water absorption and Porosity test on rock samples were performed in accordance with IS: 1124-1974-(RA:2017) and results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.15. Hardness test on rock samples were performed in accordance with IS: 13630 (part-XIII) -2019 and results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.16. Unconfined Compressive Strength tests on rock samples were performed in accordance with IS 9143-1979-(RA:2021) and results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.17. Point load index tests on rock samples were performed in accordance with IS: 8764-1998-(RA:2019) and results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.18. Cerchar Abrasive Index test on rock samples were performed in accordance with ASTM-D7625 and results have been reported in Table 1 to 2: “SUMMARY OF TEST RESULTS” of Appendix B.

5.19. Chemical analysis on soil samples was performed in accordance with IS: 2720 (Part-XXVI)-1987-(RA: 2021) for Ph value, IS: 2720 (Part-XXVII)-1977-(RA: 2020) for Sulphate & BS:1377-3-2018 for chlorides and results have been reported in Table 3 “CHEMICAL TEST ON SOIL SAMPLES” of Appendix B.

5.20. Chemical analysis on Ground Water sample was performed in accordance with IS: 3025 (Part-XI)-2022 for Ph value, IS: 3025 (Part-XXIV: Sec-1)-2022 for Sulphate & IS: 3025-(Part-XXXII)-1988-(RA: 2019) for chlorides and results have been reported in Table 4 “CHEMICAL TEST ON GROUND WATER SAMPLES” of Appendix B.

6. GROUND WATER TABLE:

The water table at this site was encountered during the drilling operation up to the depth of investigation.

Borehole No.	Chainage	Global Co-ordinates (UTM format)		Reduced level (m)	Depth of Borehole (m)	Water table (m)
		Easting	Northing			
P138B	24530.463	700895.449	3121462.977	209.246	40.00	18.00
P143B	24661.464	700849.414	3121585.595	205.068	40.00	14.40

7. DESCRIPTION OF STRATA:

The classification of soil stratum has been done with the help of soil characteristics obtained in laboratory tests as per IS 1498-1970-(RA:2021). The classification of rock masses has been done based on RMR as per IS: 4464-1985, IS: 13365-1. The detailed nature of the strata has been reported in Table 1 to 2: "SUMMARY OF TEST RESULTS" of Appendix-B and represented through Lithological plots in Appendix-C.

The strata exhibited in the bore hole, P138B is predominantly consisting of silty sands with inorganic silty clays of low plasticity. Borehole P143B consists of Silty sands upto the depth of 17.00 m. Inorganic silty clays of low plasticity were also encountered in between the depth of 10.00 to 11.30 metres. Rock mass encountered at the depth of 11.30 metres to 12.80 metres, and then after 17.05 metres to the depth of investigation. The rock mass is in various stage of weathering, i.e., highly to completely weathered and classified as **Quartzite**. The entire rock mass is of medium to fine grained, non-foliated, **Abrasion Index** and rock hardness falling in the range of **high to very high**.

8. CLASSIFICATION CRITERIA OF ROCK MASSES:

Rock classification in terms of weathering, state of fractures and strength is carried out in the following manner based on IS: 4464-1985, IS: 13365-1. Tabulations given in below explain it briefly.

TERMS	DESCRIPTION	GRADE	GEOLOGIST INTERPRETATION
Fresh	No visible sign of rock material weathering; perhaps slight coloration on major discontinuity surfaces	I	CR > 90 %

TERMS	DESCRIPTION	GRADE	GEOLOGIST INTERPRETATION
Slightly Weathered	Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discoloured by weathering.	II	CR between 70 % to 90 %
Moderately Weathered	Less than half of the rock material is decomposed or disintegrated to a soil. Fresh or discoloured rock is present either as a continuous framework or as core-stones.	III	CR between 51 % to 70 %
Highly Weathered	More than half of the rock material is decomposed or disintegrated to a soil. Fresh or discoloured rock is present either as a discontinuous framework or as core-stones.	IV	CR between 11 % to 50 %
Completely weathered	All rock material is decomposed and / or disintegrated to soil. The original mass structure is still largely intact.	V	CR between zero to 10 %
Residual Soil	All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported.	VI	CR = Zero % But N > 50

CR indicate Core Recovery

It should be understood that all grades of weathering may not be seen in a given rock mass and that in some cases a particular grade may be present to a very small extent. Distribution of the various weathering grades of rock material in the rock mass may be related to the porosity of the rock material and the presence of open discontinuities of all types in the rock mass.

8.1 Relation between RQD and In-situ Rock quality:

Relation between RQD and In-situ

Rock quality is further measured by frequency of natural joints in rock mass. Rock Quality Designation (RQD) is used to define state of fractures or massiveness of rock. Following table defines the quality of rock mass.

RQD classification	RQD (%)
Excellent	91 to 100
Good	76 to 90
Fair	51-75
Poor	25-50

RQD classification	RQD (%)
Very Poor	0-25

8.2 Classification of Rock by Compressive Strength:

Rock type	Unconfined compressive strength (MPa)
Extremely strong	>200
Very Strong	100 to 200
Strong	50 to 100
Moderately Strong	12.5 to 50
Moderately Weak	5 to 12.5
Weak	1.25 to 5
Very weak	<1.25

9. SAFE BEARING CAPACITY COMPUTATIONS:

For the construction of viaducts, deep foundation proposed to be resting on soil and rock mass **(Bored Cast-In-Situ RCC piles** and **bored cast-in-situ rock socketed RCC piles)** have been considered for computation of load bearing capacity of the underlying strata. The computation of load bearing capacity of bored cast-in-situ RCC piles have been done as per IS 2911 (part-1, section-2)-2010-(RA: 2020) and rock socketed RCC piles as per IRC:78-2014, with due consideration of effects of liquefaction.

9.1. Pile Load Capacity in soils:

9.1.1. Design Parameters:

Factor of safety in Compression	=	2.50
Factor of safety in Tension	=	3.00
Depth of critical water table	=	0.00 m
Diameter of pile	=	1.00 & 1.20 m
Cut off length	=	2.50 m
Type of pile head consider	=	Fixed

9.1.2. Computation of friction along pile stem:

$Q_{uf} = \sum K_i . P_{di} . \tan\delta_i . A_{si}$

where,

Q_{uf}	=	Ultimate shaft friction (kN/m^2)
K_i	=	Coefficient of earth pressure at mid-depth of i^{th} layer
P_{di}	=	Effective overburden pressure at mid-depth of i^{th} layer (kN/m^2)
A_{si}	=	Surface area of pile stem in i^{th} layer (m^2)
δ_i	=	Angle of wall friction between pile and soil of i^{th} layer (= ϕ) (degree)
ϕ_i	=	Angle of internal friction of soil in i^{th} layer (degree)
Σ	=	Sum of all layers up to i^{th} layer

9.1.3. Computation of Cohesion along the stem of pile:

$Q_{uc} = \sum \alpha_i . c_i . A_{si}$

where,

c_i	=	Cohesion in i^{th} layer
A_{si}	=	Surface area of pile stem in i^{th} layer (m^2)
α_i	=	Adhesion factor for i^{th} layer of soil depending of consistency of soils
Σ	=	Sum of cohesion of all layers considered

9.1.4. Computation of end bearing resistance:

$Q_{ub} = A_p (c.N_c + q.N_q + 0.5.\gamma.B.N_\gamma)$

where,

A_p	=	Area of the pile toe (m^2)
c	=	cohesion of soils at pile toe (kN/m^2)
γ	=	Effective Unit weight of soils at pile toe (kN/m^3)
B	=	Diameter of pile (m)
q	=	Effective overburden pressure at pile toe (kN/m^2)
N_c	=	Bearing Capacity Factor (Recommended equal to 9)
N_q, N_γ	=	Bearing Capacity Factor

9.1.5. Lateral load capacity of piles in soils:

$Q_u = 12.E.I.\delta/(L_1+L_f)^3$

where,

Q_u	=	Ultimate lateral load capacity of pile (kN)
δ	=	Permissible deflection (m) = 5 mm
E	=	Young Modulus of pile material (kN/m^2)
I	=	Moment of Inertia of the pile cross section (m^4)
L_1	=	Cantilever Length of pile (m)
L_f	=	Length of fixity (m)

Detailed calculations of pile load carrying capacity in compression & uplift in soil have been reported in **Table-3 to 4** of **Appendix-I.**

Pile lateral Load capacity has been given in **Table-5 to 6** of **Appendix-I**.

9.2. Pile Load Capacity in rock:

Computations of the vertical load capacity of the piles in rock has been work out as per the method given in IRC:78-2014.

9.2.1. As per IRC:78-2014:

Since the rock mass encountered at this site exhibits (CR+RQD)/2< **30%**, Method 2 of IRC: 78-2014 has been used for computing the axial pile load capacity in rock formations.

$$\mathbf{Q_a = R_e/3 + R_{af}/6}$$

$$\mathbf{Q_t = R_{af}/6 + \text{Self weight of pile}}$$

where,

R_e = C_{ub} x N_c x A_b

R_{af} = C_{us} x A_s

D = Diameter of the pile (m)

Q_a = Allowable load capacity of pile socketed into rock (kN)

Q_t = Allowable load capacity of pile in uplift (kN)

R_e = Ultimate end bearing capacity (kN/m^2)

R_{af} = Ultimate side socket shear capacity (kN/m^2)

C_{ub} = Average shear strength below base of pile tip for depth upto 2D

L_s = Socket length of pile (m)

N_c = Bearing Capacity factor = 9 (as per code)

A_b = Area of pile base (m^2)

A_s = Area of socket (m^2)

C_{us} = Shear strength along socket length (≤ 3.0 for M35 Concrete).

The detailed calculations of pile load carrying capacity in compression and uplift on rock based on method-2 of IRC: 78-2014 have been reported in **Table-2** of **Appendix-I.**

9.3. Computation of RMR values:

A gross estimate of bearing capacity of completely or partially weathered rock masses have been done based on Rock Mass Rating (RMR). The estimation of RMR value of jointed rock masses have been worked out based on IS 13365 (part I). Rock Mass Rating parameters are reproduced from Annexure B of IS 13365 (part I) below for ready reference. The final RMR value of rock is referred from the Table 3 of IS code 12070.

9.3.1. Rating as per UCS

Description	Compressive Strength (MPa)	Rating	Basis
Exceptionally Strong	>250	15	UCS value data of specific borehole from laboratory test is used in RMR
Very Strong	100 to 250	12	
Strong	50 to 100	7	
Average	25 to 50	4	
Weak	10 to 25	2	
Very Weak	2 to 10	1	
Extremely Weak	<2	0	

9.3.2. Rating as per RQD

Description	RQD (%)	Rating	Basis
Excellent	91 to 100	20	RQD values of specific boreholes below given depth from relevant borehole are used in RMR.
Good	76 to 90	17	
Fair	51 to 75	13	
Poor	26 to 50	8	
Very Poor	0 to 25	3	

9.3.3. Rating as per Spacing of discontinuities

Description	Spacing (m)	Rating	Basis
Vey wide	>2	20	Spacing of discontinuities of specific borehole from field observations is used in RMR
Wide	0.6 to 2	15	
Moderate	0.2 to 0.6	10	
Close	0.06 to 0.2	8	
Very close	<0.06	5	

9.3.4. Rating as per Condition of discontinuities

Condition	Rating
Very rough and un-weathered rock wall rock, tight and discontinuous, no separation	30
rough and slightly weathered wall rock surface, separation < 1mm	25
slightly rough and moderately to highly weathered wall rock surface, separation< 1mm	20
Slickensides wall rock surface or 1-5mm thick gauge or1-5 mm wide opening, continuous discontinuity	10
Soft gauge> 5 mm thick or Separation > 5 mm	0

9.3.5. Rating as per Ground Water Conditions

General Description	Rating
Completely dry	15
Damp	10
Wet	7

General Description	Rating
Dripping	4
Flowing	0

9.3.6. Rating as per adjustment for discontinuity orientations

Strike and dip orientations of discontinuities	Very favourable	Favourable	Fair	Un-favourable	Very Un-favourable
Foundation	0	-2	-7	-15	-35

9.3.7. Net safe bearing pressures based on RMR as per Table 3 of IS:12070-1987-(RA: 2020)

Classification No.	I	II	III	IV	V
Rock Description	Very Good	Good	Fair	Poor	Very Poor
RMR	100-81	80-61	60-41	40-21	20-0
Q_{net} (t/m^2)	600-448	440-288	280-141	135-48	45-30

The results of Rock Mass Rating have been reported in **Table-1** of **Appendix-I.**

10. LIQUEFACTION ANALYSIS:

Liquefaction is the sudden loss of shear strength of the loose fine sands due to earthquake-induced vibration under saturated conditions. Liquefaction generally takes place in loose fine sands (fines < 10 %, D_{60}= 0.20 mm to 1.0 mm and C_u between 2 to 5) with N value less than 15. In case of soil strata having N>15, liquefaction of soil will not take place normally.

The present site falls in **seismic zone – IV.** Considering the history of past earthquakes and available seismic data, an earthquake of **magnitude 7.0** having peak ground acceleration **a_{max}= 0.24 g** is considered in the present analysis.

Preliminary assessment of liquefaction potential of foundation strata is made by simplified approach proposed by IS: 1893 (part-1)-2016-(RA: 2021) from the data obtained in Standard Penetration Test.

In this method, cyclic shear stress likely to be induced in the foundation strata by Design Basis Earthquake is first evaluated. Next threshold cyclic shear stress, which is good enough to cause liquefaction, is determined from SPT data and the empirical relations. Finally, comparison of these two stresses is used in the estimation of liquefaction susceptibility of the foundation strata.

Cyclic Stress Ratio (CSR):

The equivalent average of shear stress likely to be induced in the foundation material due to an earthquake is calculated by using the equations

Cyclic Resistance Ratio (CRR):

It expresses capacity of soil to resist liquefaction. CRR is determined using correlation between corrected blow count $(N_1)_{60}$ and CRR for earthquake of magnitude 7.5. $(N_1)_{60}$ is the SPT blow count corrected to an effective overburden pressure of 100 kPa and to hammer energy efficiency of 60 %.

Following variable have been adopted in calculation of N_{60} (SPT value for 60% efficiency)

Energy correction to SPT values:

C_{60} = 1.00 (energy efficiency factor)

Design Earthquake Base:

Earthquake zone	= IV
Magnitude of earthquake	= 7
Seismic Zone factor	= 0.24

Status of Liquefaction:

The value of CSR and CRR are computed at different depth and then the ratio of CRR to CSR to get the factor of safety towards the susceptibility of the stratum towards liquefaction potential.

If factor of safety:

$<$ 1.00 : Stratum is to be considered as liquefiable

$>$ 1.20 : Non-Liquefiable

The detailed calculations of liquefaction, have been reported in **Table-7** of **Appendix-I.**

11. RECOMMENDATIONS:

Keeping in mind, the field test results, laboratory test results and IS codes of practice the following recommendations are hereby made:

11.1. **Bored Cast-In-Situ RCC Piles** of diameter 1000 and 1200 mm have been adopted for SBC computations of foundation for Viaduct.

11.2. **Cut off length** of piles have been considered as 2.50 m from the existing ground level for the purpose of computation of SBC.

11.3. **Pile length** recommended in the table below, shall be measured **after the cut-off depth.**

11.4. **Allowable load carrying capacity** of pile corresponding to the length and diameter of pile shall be read from the tables below:

11.4.1. For Pile diameter = 1000 mm

Borehole No.	End bearing Strata type	Pile Length (m)	Rock Socket length (m)	Load carrying Capacity (kN)		
				Compression	Uplift	Lateral Concrete M35*
P138B	Soil	25.00	-	2850	1500	165
		27.50		2150	1700	
		30.00		3300	1900	
		32.50		3450	2100	
		35.00		3600	2300	
P143B	Rock	18.00	3.50	4580	3250	315

** Indicates Grade of Concrete*

11.4.2. For Pile diameter = 1200 mm

Borehole No.	End bearing Strata type	Pile Length (m)	Rock Socket length (m)	Load carrying Capacity (kN)		
				Compression	Uplift	Lateral Concrete M35*
P138B	Soil	25.00	-	4400	2000	235
		27.50		2900	2250	
		30.00		4950	2550	

Borehole No.	End bearing Strata type	Pile Length (m)	Rock Socket length (m)	Load carrying Capacity (kN)		
				Compression	Uplift	Lateral Concrete M35*
		32.50		5250	2850	
		35.00		5350	3150	
P143B	Rock	18.70	4.20	6600	4750	435

* *Indicates Grade of Concrete*

11.5. Liquefaction Potential: Both the bore holes have been analysed for Liquefaction potential as per IS: 1893 (part-1)-2016-(RA: 2021) with Seismic Zone IV, earthquake intensity of 7.0 on Richter scale and critical ground water table at existing ground level. The details of liquefaction potential in various boreholes corresponding to depths has been mentioned in the table below:

Bore No.	Liquefiable depth zone (meter)
P138B	Top 3.00
P143B	None

11.6. Type of cement to be used: Since, the effect of harmful chemical at the site are found within the permissible limits. So, Ordinary Portland Cement or Portland Pozzolana Cement may be used for all civil constructions.
